[20882] VGAM444 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM444 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM444 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20883] The complementary binding of VGAM444 RNA, herein designated VGAM RNA, to host target binding sites on VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM444 host target RNA into VGAM444 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20884] It is appreciated that VGAM444 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM444 host target genes. The mRNA of each one of this plurality of VGAM444 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM444 RNA, herein designated VGAM RNA, and which when bound by VGAM444 RNA causes inhibition of translation of respective one or more VGAM444 host target proteins.

[20885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM444 gene, herein designated VGAM GENE, on one or more VGAM444 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20886] It is yet further appreciated that a function of VGAM444 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM444 correlate with, and may be deduced from, the identity of the host target genes which VGAM444 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20887] Nucleotide sequences of the VGAM444 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM444 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM444 are further described hereinbelow with reference to Table 1.

[20888] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM444 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM444 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20889] As mentioned hereinabove with reference to Fig. 1, a function of VGAM444 gene, herein designated VGAM is inhibition of expression of VGAM444 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM444 correlate with, and may be deduced from, the identity of the target genes which VGAM444 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20890] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398) is a VGAM444 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40336, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20891] A function of VGAM444 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 has been established by previous studies. Vertebrate homologs of the Drosophila discs large (dlg) gene are members of the MAGUK (membrane-associated guanylate kinase) family. See 602887. MAGUK proteins contain PDZ motifs, an SH3 domain, and a guanylate kinase (GUK)-homologous region. Both the PDZ and GUK domains are thought to contribute to protein-protein interactions. By searching an EST database for sequences related to Drosophila dlg, Nakamura et al. (1998) identified cDNAs encoding a novel human homolog. Northern blot analysis revealed that the 9.4-kb transcript was highly expressed in placenta and prostate, as well as in several other tissues, leading the authors to designate the gene PDLG (placenta and prostate DLG). An additional 8.8-kb PDLG mRNA was detected in thyroid. The predicted 859-amino acid PDLG protein contains 3 PDZ domains, an SH3 domain, and a

GUK region. PDLG is 45% and 40% identical to DLG1 (OMIM Ref. No. 601014) and *Drosophila* dlg, respectively. Western blot analysis of extracts of human prostate tissue and various cell lines showed that PDLG has an apparent molecular mass of 105 kD. Immunofluorescence experiments indicated that PDLG is localized at the plasma membrane and cytoplasm, and is expressed in the gland epithelial cells of normal prostate tissue but not in prostate cell lines. Using a yeast 2-hybrid screen, Nakamura et al. (1998) determined that PDLG interacts with the GUK domain of p55 (MPP1; 305360), a palmitoylated erythrocyte membrane MAGUK protein. The authors suggested that PDLG and p55 form a heteromeric MAGUK complex at the plasma membrane and cluster various intracellular molecules to play roles in maintaining the structure of epithelial cells and transmitting extracellular signals to the membrane and cytoskeleton. Independently, Nagase et al. (1998) identified KIAA0583, a DLG5 cDNA. By radiation hybrid analysis, they mapped the DLG5 gene to chromosome 10. Using the same technique, Nakamura et al. (1998) refined the localization of the DLG5 gene to 10q23.

[20892] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[20893] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 5: 31–39, 1998.  
; and

[20894] Nakamura, H.; Sudo, T.; Tsuiki, H.; Miyake, H.; Morisaki, T.; Sasaki, J.; Masuko, N.; Kochi, M.; Ushio, Y.; Saya, H. : Identification of a novel human homolog of the Drosophila dlg, P-d.

[20895] Further studies establishing the function and utilities of DLG5 are found in John Hopkins OMIM database record ID 604090, and in cited publications numbered 6735 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fc Fragment of IgG, Low Affinity IIa, Receptor For (CD32) (FCGR2A, Accession XM\_086483) is another VGAM444 host target gene. FCGR2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FCGR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FCGR2A BINDING SITE, designated SEQ ID:38699, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20896] Another function of VGAM444 is therefore inhibition of Fc Fragment of IgG, Low Affinity Ila, Receptor For (CD32) (FCGR2A, Accession XM\_086483), a gene which binds IgG immune complexes; member of the immunoglobulin superfamily. Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCGR2A. The function of FCGR2A has been established by previous studies. Receptors for the Fc portion of IgG play an essential role in the protection of the organism against foreign antigens by removing antigen-antibody complexes from the circulation. Receptors are present on monocytes, macrophages, neutrophils, natural killer (NK) cells, and T and B lymphocytes, and they participate in diverse functions such as phagocytosis of immune complexes and modulation of antibody production by B cells. Hibbs et al. (1988) isolated cDNA clones for the FcGR gene by cross-species hybridization by probing cDNA libraries with a low-affinity FcGR beta-1

cDNA clone from mouse, as well as a pool of oligonucleotides constructed from the nucleotide sequence of this FcGR. Analysis of the amino acid sequence predicted from cDNA clones indicated that the human FcGR protein is synthesized with a 34-amino acid leader and that the mature protein is composed of 281 amino acids. The extracellular region of this FcGR was divided into 2 domains, which were very similar to each other and to the corresponding regions of both mouse alpha and beta FcGRs and showed a clear relationship to immunoglobulin variable regions. Grundy et al. (1988) mapped the immunoglobulin Fc receptor II and Fc receptor III genes to chromosome 1 by means of spot-blot analysis of sorted chromosomes. By hybridizing each probe to human DNA digested with 8 different 'rare-cutting' restriction enzymes and separated by pulsed field gel electrophoresis, Grundy et al. (1988) showed that the 2 genes mapped to the same fragment, the smallest of which was 250 kb long. Peltz et al. (1989) showed physical linkage of the 2 genes within a maximum distance of 200 kb. The conclusion on the basis of Southern and in situ data of Grundy et al. (1989) that there are three 8- to 10-kb Fc-gamma-RII loci per haploid genome was confirmed by Qiu et al. (1990), who

named the genes A, A-prime, and B to reflect their homology and presumed evolution. Lebo et al. (1991) noted that occasionally these 3 genes, which lie within a 200-kb region, could be resolved in individual metaphase chromatids by multicolor fluorescence in situ hybridization. By in situ hybridization, Sammartino et al. (1988) assigned the IGFR2 gene to 1q23-q24. In the course of constructing a physical map of human 1q21-q23, Oakey et al. (1992) placed FCGR2A in that region, close to MPP (OMIM Ref. No. 159440) and APOA2 (OMIM Ref. No. 107670). The homologous gene in the mouse, Ly-17, maps to mouse chromosome 1 (Hibbs et al., 1985). See review by Unkeless (1989).

[20897] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20898] Peltz, G. A.; Grundy, H. O.; Lebo, R. V.; Yssel, H.; Barsh, G. S.; Moore, K. W. : Human Fc-gamma-RIII: cloning, expression, and identification of the chromosomal locus of two Fc receptors for IgG. Proc. Nat. Acad. Sci. 86: 1013-1017, 1989. ; and

[20899] Salmon, J. E.; Millard, S.; Schachter, L. A.; Arnett, F. C.; Ginzler, E. M.; Gourley, M. F.; Ramsey-Goldman, R.; Peter-

son, M. G. E.; Kimberly, R. P. : Fc-gamma-RIIA alleles are heritabl.

[20900] Further studies establishing the function and utilities of FCGR2A are found in John Hopkins OMIM database record ID 146790, and in cited publications numbered 392 and 3930–3940 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lysophospholipase I (LYPLA1, Accession NM\_006330) is another VGAM444 host target gene. LYPLA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LYPLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYPLA1 BINDING SITE, designated SEQ ID:13027, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20901] Another function of VGAM444 is therefore inhibition of Lysophospholipase I (LYPLA1, Accession NM\_006330). Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYPLA1. Prodynorphin (PDYN, Accession

NM\_024411) is another VGAM444 host target gene. PDYN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDYN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDYN BINDING SITE, designated SEQ ID:23652, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20902] Another function of VGAM444 is therefore inhibition of Prodynorphin (PDYN, Accession NM\_024411), a gene which is an opioid peptide acting on the kappa-receptor . Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDYN. The function of PDYN has been established by previous studies. Horikawa et al. (1983) cloned a human genomic DNA segment containing the preproenkephalin B gene. From studies of the gene for porcine preproenkephalin B, it is known to contain the determinants for neoendorphin, dynorphin, and leumorphin (containing rimorphin in its amino-terminus). These opioid peptides, each with a leucine-enkephalin structure, act on the kappa-receptor. The structural organization of

the gene resembles that of the genes encoding the other opioid peptide precursors, preproenkephalin A (OMIM Ref. No. 131330) and preproopiomelanocortin (OMIM Ref. No. 176830). Litt et al. (1987, 1988) assigned the PDYN gene to human chromosome 20 by Southern blot analysis of DNAs from a rodent–human somatic cell hybrid panel. In situ hybridization to metaphase chromosomes confirmed this assignment and indicated the regional localization to be 20pter–p12. Summar et al. (1990) demonstrated very close linkage of PDYN with ARVP (OMIM Ref. No. 192340) and OT (OMIM Ref. No. 167050); no recombinants were found with a lod score of 5.2. This cluster of genes appears to be located about 15 cM distal to D20S5, which is located near the middle of the short arm at 20p12.21. In connection with this close proximity of the genes, it is noteworthy that the ARVP and PDYN peptides are coexcreted in the same neurosecretory granules of some pituitary axons and that increased transcription of both genes occurs with osmotic stimulation. Temporal lobe epilepsy is a common, heterogeneous epilepsy syndrome with both environmental and genetic factors playing a role in its etiology (Berkovic et al., 1996; Cendes et al., 1998). Ottman et al. (1995) localized a gene for partial epilepsy with au–

ditary features (OMIM Ref. No. 600512) to 10q; by a positional candidate gene approach, Kalachikov et al. (2002) found that mutations in the LGI1 gene are responsible for this form of temporal lobe epilepsy. Stogmann et al. (2002) performed a case control association study in 155 patients with nonlesional temporal lobe epilepsy and 202 controls, and found that the PDYN promoter low-expression L alleles (1 or 2 repeats) conferred an increased risk for temporal lobe epilepsy in patients with a family history for seizures. Irrespective of the familial background, L homozygotes displayed a higher risk for secondarily generalized seizures and status epilepticus.

[20903] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20904] Summar, M. L.; Phillips, J. A., III; Battey, J.; Castiglione, C. M.; Kidd, K. K.; Maness, K. J.; Weiffenbach, B.; Gravius, T. C. : Linkage relationships of human arginine vasopressin-neurophysin-II and oxytocin-neurophysin-I to prodynorphin and other loci on chromosome 20. Molec. Endocr. 4: 947-950, 1990. ; and

[20905] Stogmann, E.; Zimprich, A.; Baumgartner, C.; Aull-Watschinger, S.; Holtt, V.; Zimprich, F. : A functional poly-

morphism in the prodynorphin gene promoter is associated with temporal lobe.

[20906] Further studies establishing the function and utilities of PDYN are found in John Hopkins OMIM database record ID 131340, and in cited publications numbered 3568–3570, 4227–356 and 4571–4574 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM\_003036) is another VGAM444 host target gene. SKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKI BINDING SITE, designated SEQ ID:8988, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20907] Another function of VGAM444 is therefore inhibition of V-ski Sarcoma Viral Oncogene Homolog (avian) (SKI, Accession NM\_003036). Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKI. KIAA0652 (Accession NM\_014741) is another VGAM444 host target

gene. KIAA0652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0652 BINDING SITE, designated SEQ ID:16408, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20908] Another function of VGAM444 is therefore inhibition of KIAA0652 (Accession NM\_014741). Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652. MGC2452 (Accession NM\_032644) is another VGAM444 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26369, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20909] Another function of VGAM444 is therefore inhibition of MGC2452 (Accession NM\_032644). Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. Phospholipase A2, Group VI (cytosolic, calcium-independent) (PLA2G6, Accession XM\_039248) is another VGAM444 host target gene. PLA2G6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G6 BINDING SITE, designated SEQ ID:33029, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20910] Another function of VGAM444 is therefore inhibition of Phospholipase A2, Group VI (cytosolic, calcium-independent) (PLA2G6, Accession XM\_039248). Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G6. LOC145447 (Accession XM\_085133) is another VGAM444 host target gene. LOC145447 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145447 BINDING SITE, designated SEQ ID:37861, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20911] Another function of VGAM444 is therefore inhibition of LOC145447 (Accession XM\_085133). Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145447. LOC149711 (Accession XM\_097720) is another VGAM444 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41071, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20912] Another function of VGAM444 is therefore inhibition of LOC149711 (Accession XM\_097720). Accordingly, utilities

of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC253786 (Accession XM\_173109) is another VGAM444 host target gene. LOC253786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253786 BINDING SITE, designated SEQ ID:46363, to the nucleotide sequence of VGAM444 RNA, herein designated VGAM RNA, also designated SEQ ID:3155.

[20913] Another function of VGAM444 is therefore inhibition of LOC253786 (Accession XM\_173109). Accordingly, utilities of VGAM444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253786. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 445 (VGAM445) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20914] VGAM445 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM445 was detected is described hereinabove with reference to Figs. 1–8.

[20915] VGAM445 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Papillomavirus Type 17. VGAM445 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20916] VGAM445 gene encodes a VGAM445 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM445 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM445 precursor RNA is designated SEQ ID:431, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:431 is located at position 358 relative to the genome of Human Papillomavirus Type 17.

[20917] VGAM445 precursor RNA folds onto itself, forming VGAM445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20918] An enzyme complex designated DICER COMPLEX, `dices` the VGAM445 folded precursor RNA into VGAM445 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM445 RNA is designated SEQ ID:3156, and is provided hereinbelow with reference to the sequence listing part.

[20919] VGAM445 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM445 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[20920] VGAM445 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM445 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM445 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20921] The complementary binding of VGAM445 RNA, herein designated VGAM RNA, to host target binding sites on VGAM445 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM445 host target RNA into VGAM445 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20922] It is appreciated that VGAM445 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM445 host target genes. The mRNA of each one of this plurality of VGAM445 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM445 RNA, herein designated VGAM RNA, and which when bound by VGAM445 RNA causes inhibition of translation of respective one or more VGAM445 host target proteins.

[20923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM445 gene, herein designated VGAM GENE, on one or more VGAM445 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20924] It is yet further appreciated that a function of VGAM445 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of viral infection by Human Papillomavirus Type 17. Specific functions, and accordingly utilities, of VGAM445 correlate with, and may be deduced from, the identity of the host target genes which VGAM445 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20925] Nucleotide sequences of the VGAM445 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM445 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM445 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM445 are further  
described hereinbelow with reference to Table 1.

[20926] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM445 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM445 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[20927] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM445 gene, herein designated VGAM is  
inhibition of expression of VGAM445 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM445 correlate with, and may be deduced  
from, the identity of the target genes which VGAM445  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[20928] Annexin A4 (ANXA4, Accession XM\_031596) is a  
VGAM445 host target gene. ANXA4 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by ANXA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANXA4 BINDING SITE, designated SEQ ID:31444, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20929] A function of VGAM445 is therefore inhibition of Annexin A4 (ANXA4, Accession XM\_031596), a gene which inhibits phospholipase\_A2 activity. Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANXA4. The function of ANXA4 has been established by previous studies. The annexins, or lipocortins, are a family of calcium-dependent phospholipid-binding proteins whose normal function is uncertain. Annexin IV, otherwise known as placental anticoagulant protein II, was 1 of the 4 annexins isolated from human placenta on the basis of their in vitro anticoagulant activity. Grundmann et al. (1988) reported a cDNA clone for annexin IV. Hauptmann et al. (1989) showed that annexin IV has 45 to 59% identity with other members of the annexin family. By PCR analysis of

somatic cell hybrids and in situ hybridization with a cDNA probe, Tait et al. (1992) mapped the human ANXA4 gene to 2p13. Genomic Southern blotting with a cDNA probe indicated a gene size of 18– to 56–kb. DNA sequence analysis demonstrated a single intron with exon–intron boundaries in exactly the same position as in the mouse annexin I and annexin II genes. Barrow et al. (1994) demonstrated that the Anxa4 gene is located on mouse chromosome 6 in a region of conserved synteny with human chromosome 2

[20930] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20931] Barrow, L. L.; Simin, K.; Jones, J. M.; Lee, D. C.; Meisler, M. H. : Conserved linkage of early growth response 4, annexin 4, and transforming growth factor alpha on mouse chromosome 6. *Genomics* 19: 388–390, 1994. ; and

[20932] Grundmann, U.; Amann, E.; Abel, K.–J.; Kupper, H. A. : Isolation and expression of cDNA coding for a new member of the phospholipase A2 inhibitor family. *Behring Inst. Mitt.* 82: 59–67.

[20933] Further studies establishing the function and utilities of ANXA4 are found in John Hopkins OMIM database record

ID 106491, and in cited publications numbered 11668–4844 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adenomatosis Polyposis Coli (APC, Accession NM\_000038) is another VGAM445 host target gene. APC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APC BINDING SITE, designated SEQ ID:5480, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20934] Another function of VGAM445 is therefore inhibition of Adenomatosis Polyposis Coli (APC, Accession NM\_000038). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APC. Centaurin, Delta 1 (CENTD1, Accession NM\_139182) is another VGAM445 host target gene. CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENTD1, corresponding to HOST TARGET binding sites such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2, designated SEQ ID:29197 and SEQ ID:17560 respectively, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20935] Another function of VGAM445 is therefore inhibition of Centaurin, Delta 1 (CENTD1, Accession NM\_139182), a gene which is involved in cell signaling/communication. Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD1. The function of CENTD1 has been established by previous studies. By screening brain cDNAs for the potential to encode proteins that are at least 50 kD, Nagase et al. (1998) identified a partial cDNA encoding CENTD1, which they called KIAA0580. The protein was predicted to be involved in cell signaling/communication. RT-PCR analysis detected expression of KIAA0580 in all tissues tested except skeletal muscle. By searching sequence databases, followed by 5-prime RACE, Miura et al. (2002) obtained full-length cDNAs encoding CENTD1 and CENTD2 (OMIM Ref. No. 606646), which they called ARAP2 and ARAP1, respectively. Like ARAP1, the

1,704-amino acid ARAP2 protein contains ARF-GAP (see OMIM Ref. No. 103180), RHO-GAP (see OMIM Ref. No. 602732), ankyrin repeat (see OMIM Ref. No. 605787), RAS (OMIM Ref. No. 190020)-associating, and 5 pleckstrin (OMIM Ref. No. 173570) homology (PH) domains. However, unlike ARAP1, ARAP2 also has a sterile alpha motif (SAM) domain like that found in EphA receptor (see OMIM Ref. No. 179610) and a region of homology to the switch-2 domain of RAB13 (OMIM Ref. No. 602672). The RHO-GAP domain of ARAP2 lacks the predicted catalytic arginine and is therefore unlikely to have RHO-GAP activity. Northern blot analysis showed that ARAP2 is much more variably expressed than ARAP1. The highest ARAP2 expression levels were in brain, thymus, spleen, kidney, peripheral blood leukocytes, lymph node, spinal cord, and thyroid. Two messages at 7.5 and 11 kb were found in brain, and 7.5- and 8.5-kb messages were found in thymus, spleen, kidney, peripheral blood leukocytes, and lymph node. Of the hematopoietic tissues examined, only bone marrow did not show ARAP2 expression.

[20936] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [20937] Miura, K.; Jacques, K. M.; Stauffer, S.; Kubosaki, A.; Zhu, K.; Hirsch, D. S.; Resau, J.; Zheng, Y.; Randazzo, P. A. : ARAP1: a point of convergence for Arf and Rho signaling. Molec. Cell 9: 109–119, 2002. ; and
- [20938] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 10.
- [20939] Further studies establishing the function and utilities of CENTD1 are found in John Hopkins OMIM database record ID 606645, and in cited publications numbered 612 and 6735 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM\_002074) is another VGAM445 host target gene. GNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB1 BINDING SITE, designated SEQ ID:7847, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ

ID:3156.

[20940] Another function of VGAM445 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM\_002074). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB1. Janus Kinase 2 (a protein tyrosine kinase) (JAK2, Accession NM\_004972) is another VGAM445 host target gene. JAK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAK2 BINDING SITE, designated SEQ ID:11416, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20941] Another function of VGAM445 is therefore inhibition of Janus Kinase 2 (a protein tyrosine kinase) (JAK2, Accession NM\_004972), a gene which tyrosine kinase of the non-receptor type, involved in interleukin 3 signal transduction. Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with JAK2. The function of JAK2 has been established by previous studies. JAK2 kinase is a member of a family of tyrosine kinases involved in cytokine receptor signaling. See 147795 for background information on Janus kinases. In addition to its role as a kidney cytokine regulating hematopoiesis, erythropoietin (OMIM Ref. No. 133170) is also produced in the brain after oxidative or nitrosative stress. The transcription factor HIF1 (OMIM Ref. No. 603348) upregulates erythropoietin following hypoxic stimuli. Digicaylioglu and Lipton (2001) demonstrated that preconditioning with erythropoietin protects neurons in models of ischemic and degenerative damage due to excitotoxins and consequent generation of free radicals, including nitric oxide. Activation of neuronal erythropoietin receptors (EPOR; 133171) prevents apoptosis induced by NMDA or nitric oxide by triggering crosstalk between the signaling pathways JAK2 and NFkB (see OMIM Ref. No. 164011). Digicaylioglu and Lipton (2001) demonstrated that erythropoietin receptor-mediated activation of JAK2 leads to phosphorylation of the inhibitor of NFkB (I-kappa-B-alpha; 164008), subsequent nuclear translocation of the transcription factor NFkB, and NFkB-dependent transcription of neuroprotective genes. Trans-

fection of cerebrocortical neurons with a dominant interfering form of JAK2 or an I-kappa-B-alpha superrepressor blocks erythropoietin-mediated prevention of neuronal apoptosis. Thus, neuronal erythropoietin receptors activate a neuroprotective pathway that is distinct from previously well characterized JAK and NFkB functions. Moreover, this erythropoietin effect may underlie neuroprotection mediated by hypoxic-ischemic preconditioning.

Huang et al. (2001) showed that JAK2, and more specifically just its intact N-terminal domain, binds to EPOR in the endoplasmic reticulum and promotes its cell surface expression. This interaction was specific, as JAK1 had no effect. Residues 32 to 58 of the JAK2 JH7 domain were required for EPOR surface expression. Alanine scanning mutagenesis of the EPOR membrane proximal region revealed 2 modes of EPOR-JAK2 interaction. A continuous block of EPOR residues was required for functional, ligand-independent binding to JAK2 and cell surface receptor expression, whereas 4 specific residues were essential in switching on prebound JAK2 after ligand binding. Thus, in addition to its kinase activity required for cytokine receptor signaling, JAK is also an essential subunit required for surface expression of cytokine receptors. Animal

model experiments lend further support to the function of JAK2. Neubauer et al. (1998) also performed a targeted inactivation of Jak2 in mice. Jak2  $-/-$  embryos were anemic and died around day 12.5 postcoitum. Primitive erythrocytes were found, but definitive erythropoiesis was absent. Compared to erythropoietin receptor-deficient mice, the phenotype of Jak2 deficiency was more severe. Fetal liver BFU-E and CFU-E colonies were completely absent. However, multilineage hematopoietic stem cells (CD34-low, c-kit-pos) were found, and B lymphopoiesis appeared intact. In contrast to IFN-alpha stimulation, Jak2  $-/-$  cells did not respond to IFN-gamma. Jak2  $-/-$  embryonic stem cells were competent for LIF signaling. These data also demonstrated that Jak2 has pivotal functions for signal transduction of a set of cytokine receptors required in definitive erythropoiesis

[20942] It is appreciated that the abovementioned animal model for JAK2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20943] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [20944] Neubauer, H.; Cumano, A.; Muller, M.; Wu, H.; Huffstadt, U.; Pfeffer, K. : Jak2 deficiency defines an essential developmental checkpoint in definitive hematopoiesis. *Cell* 93: 397–409, 1998. ; and
- [20945] Digicaylioglu, M.; Lipton, S. A. : Erythropoietin-mediated neuroprotection involves cross-talk between Jak2 and NF-kappa-B signalling cascades. *Nature* 412: 641–647, 2001.
- [20946] Further studies establishing the function and utilities of JAK2 are found in John Hopkins OMIM database record ID 147796, and in cited publications numbered 11678, 11675, 11679–11681, 1167 and 11682–11684 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Junctional Adhesion Molecule 3 (JAM3, Accession NM\_032801) is another VGAM445 host target gene. JAM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM3 BINDING SITE, designated SEQ ID:26552, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20947] Another function of VGAM445 is therefore inhibition of Junctional Adhesion Molecule 3 (JAM3, Accession NM\_032801), a gene which is a member of the junctional adhesion molecule protein family. Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM3. The function of JAM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM\_004154) is another VGAM445 host target gene. P2RY6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY6 BINDING SITE, designated SEQ ID:10352, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20948] Another function of VGAM445 is therefore inhibition of Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM\_004154), a gene which mediates

cellular responses to nucleotides. Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY6. The function of P2RY6 has been established by previous studies. Chang et al. (1995) discovered the first receptor of the P2Y6 type in rat. The human ortholog was identified by Communi et al. (1996). Maier et al. (1997) identified 3 isoforms of P2Y6 cDNA. Two contained the same contiguous open reading frames, but differed in their 5-prime untranslated regions and may, therefore, originate by alternative splicing; the third represented a pseudogene. Analysis of P2Y receptor subtype expression in human bone and 2 osteoblastic cell lines by RT-PCR showed that all known human P2Y receptor subtypes were expressed: P2Y1 (P2RY1; 601167), P2Y2, P2Y4, P2Y6, and P2Y7 (OMIM Ref. No. 601531). In contrast, analysis of brain-derived cell lines suggested that a selective expression of P2Y receptor subtypes occurs in brain tissue. By somatic cell hybridization, Pidlaoan et al. (1997) mapped the P2RY6 gene to 11q13.3-q13.5. By fluorescence in situ hybridization and by sequence tagged site (STS) mapping using the National Center for Biotechnology Information (NCBI) database, Somers et al. (1997) mapped the P2RY6

gene to 11q13.5, between polymorphic markers D11S1314 and D11S916. Further NCBI database analysis of the P2Y purinoceptor genes revealed that P2RY2 (OMIM Ref. No. 600041) maps within less than 4 cM of P2RY6. This was the first chromosomal clustering of this gene family to be described. By phylogenetic analysis of the P2Y purinoceptor family, Somers et al. (1997) demonstrated the presence of 5 evolutionary branches and suggested the occurrence of an ancient gene duplication event.

[20952] Further studies establishing the function and utilities of P2RY6 are found in John Hopkins OMIM database record ID 602451, and in cited publications numbered 6319–632

and 7718 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM\_006823) is another VGAM445 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13698, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20953] Another function of VGAM445 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM\_006823). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. Retinoblastoma Binding Protein 5 (RBBP5, Accession NM\_005057) is another VGAM445 host target gene. RBBP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of RBBP5 BINDING SITE, designated SEQ ID:11484, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20954] Another function of VGAM445 is therefore inhibition of Retinoblastoma Binding Protein 5 (RBBP5, Accession NM\_005057). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP5. Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM\_015049) is another VGAM445 host target gene. ALS2CR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALS2CR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2CR3 BINDING SITE, designated SEQ ID:17408, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20955] Another function of VGAM445 is therefore inhibition of Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM\_015049).

Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR3. DKFZp566D133 (Accession XM\_050005) is another VGAM445 host target gene. DKFZp566D133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp566D133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D133 BINDING SITE, designated SEQ ID:35543, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20956] Another function of VGAM445 is therefore inhibition of DKFZp566D133 (Accession XM\_050005). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D133. DKFZp761O0113 (Accession NM\_018409) is another VGAM445 host target gene. DKFZp761O0113 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761O0113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761O0113 BINDING SITE, designated SEQ ID:20445, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20957] Another function of VGAM445 is therefore inhibition of DKFZp761O0113 (Accession NM\_018409). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O0113. FLJ10330 (Accession NM\_018061) is another VGAM445 host target gene. FLJ10330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10330 BINDING SITE, designated SEQ ID:19830, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20958] Another function of VGAM445 is therefore inhibition of FLJ10330 (Accession NM\_018061). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10330.

FLJ10525 (Accession NM\_018126) is another VGAM445 host target gene. FLJ10525 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10525 BINDING SITE, designated SEQ ID:19913, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20959] Another function of VGAM445 is therefore inhibition of FLJ10525 (Accession NM\_018126). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10525. FLJ14457 (Accession NM\_032788) is another VGAM445 host target gene. FLJ14457 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14457 BINDING SITE, designated SEQ ID:26541, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3156.

[20960] Another function of VGAM445 is therefore inhibition of FLJ14457 (Accession NM\_032788). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14457. FLJ20273 (Accession NM\_019027) is another VGAM445 host target gene. FLJ20273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20273 BINDING SITE, designated SEQ ID:21112, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20961] Another function of VGAM445 is therefore inhibition of FLJ20273 (Accession NM\_019027). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20273. FLJ20986 (Accession NM\_024524) is another VGAM445 host target gene. FLJ20986 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20986, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20986 BINDING SITE, designated SEQ ID:23726, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20962] Another function of VGAM445 is therefore inhibition of FLJ20986 (Accession NM\_024524). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20986. KIAA0408 (Accession NM\_014702) is another VGAM445 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16230, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20963] Another function of VGAM445 is therefore inhibition of KIAA0408 (Accession NM\_014702). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0408. KIAA0676 (Accession NM\_015043) is another VGAM445 host target gene. KIAA0676 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:17392, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20964] Another function of VGAM445 is therefore inhibition of KIAA0676 (Accession NM\_015043). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676. KIAA0844 (Accession NM\_014951) is another VGAM445 host target gene. KIAA0844 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0844 BINDING SITE, designated SEQ ID:17282, to the

nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20965] Another function of VGAM445 is therefore inhibition of KIAA0844 (Accession NM\_014951). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0844. KIAA1327 (Accession XM\_051146) is another VGAM445 host target gene. KIAA1327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1327 BINDING SITE, designated SEQ ID:35761, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20966] Another function of VGAM445 is therefore inhibition of KIAA1327 (Accession XM\_051146). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1327. KIAA1500 (Accession XM\_034353) is another VGAM445 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32063, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20967] Another function of VGAM445 is therefore inhibition of KIAA1500 (Accession XM\_034353). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. KIAA1617 (Accession XM\_166140) is another VGAM445 host target gene. KIAA1617 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1617 BINDING SITE, designated SEQ ID:43940, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20968] Another function of VGAM445 is therefore inhibition of KIAA1617 (Accession XM\_166140). Accordingly, utilities

of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1617. KIAA1826 (Accession XM\_040784) is another VGAM445 host target gene. KIAA1826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1826 BINDING SITE, designated SEQ ID:33374, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20969] Another function of VGAM445 is therefore inhibition of KIAA1826 (Accession XM\_040784). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1826. MGC4737 (Accession NM\_031466) is another VGAM445 host target gene. MGC4737 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4737

BINDING SITE, designated SEQ ID:25503, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20970] Another function of VGAM445 is therefore inhibition of MGC4737 (Accession NM\_031466). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4737. NDRG Family Member 4 (NDRG4, Accession NM\_020465) is another VGAM445 host target gene. NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2, designated SEQ ID:21695 and SEQ ID:23210 respectively, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20971] Another function of VGAM445 is therefore inhibition of NDRG Family Member 4 (NDRG4, Accession NM\_020465). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with NDRG4. SMOC1 (Accession NM\_022137) is another VGAM445 host target gene. SMOC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC1 BINDING SITE, designated SEQ ID:22698, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20972] Another function of VGAM445 is therefore inhibition of SMOC1 (Accession NM\_022137). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC1. Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM\_007107) is another VGAM445 host target gene. SSR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR3 BINDING SITE, designated SEQ ID:13968, to the nucleotide sequence of

VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20973] Another function of VGAM445 is therefore inhibition of Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM\_007107). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR3. Ubiquitin Specific Protease 22 (USP22, Accession XM\_042698) is another VGAM445 host target gene. USP22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP22 BINDING SITE, designated SEQ ID:33749, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20974] Another function of VGAM445 is therefore inhibition of Ubiquitin Specific Protease 22 (USP22, Accession XM\_042698). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP22. Yes-associated Pro-

tein 1, 65kDa (YAP1, Accession NM\_006106) is another VGAM445 host target gene. YAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:12747, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20975] Another function of VGAM445 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. LOC147358 (Accession XM\_011089) is another VGAM445 host target gene. LOC147358 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147358 BINDING SITE, designated SEQ ID:30166, to the nucleotide sequence of

VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20976] Another function of VGAM445 is therefore inhibition of LOC147358 (Accession XM\_011089). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147358. LOC151647 (Accession XM\_087261) is another VGAM445 host target gene. LOC151647 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151647 BINDING SITE, designated SEQ ID:39153, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20977] Another function of VGAM445 is therefore inhibition of LOC151647 (Accession XM\_087261). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151647. LOC163255 (Accession XM\_092121) is another VGAM445 host target gene. LOC163255 BINDING SITE1 through LOC163255 BINDING SITE3 are HOST TAR-

GET binding sites found in untranslated regions of mRNA encoded by LOC163255, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163255 BINDING SITE1 through LOC163255 BINDING SITE3, designated SEQ ID:40105, SEQ ID:40106 and SEQ ID:40104 respectively, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20978] Another function of VGAM445 is therefore inhibition of LOC163255 (Accession XM\_092121). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163255. LOC201164 (Accession XM\_113904) is another VGAM445 host target gene. LOC201164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:42526, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20979] Another function of VGAM445 is therefore inhibition of LOC201164 (Accession XM\_113904). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164. LOC201895 (Accession XM\_114396) is another VGAM445 host target gene. LOC201895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201895 BINDING SITE, designated SEQ ID:42925, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20980] Another function of VGAM445 is therefore inhibition of LOC201895 (Accession XM\_114396). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201895. LOC203523 (Accession XM\_114713) is another VGAM445 host target gene. LOC203523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203523, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203523 BINDING SITE, designated SEQ ID:43052, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20981] Another function of VGAM445 is therefore inhibition of LOC203523 (Accession XM\_114713). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203523. LOC219690 (Accession XM\_167572) is another VGAM445 host target gene. LOC219690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219690 BINDING SITE, designated SEQ ID:44704, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20982] Another function of VGAM445 is therefore inhibition of LOC219690 (Accession XM\_167572). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219690. LOC253959 (Accession XM\_170749) is another VGAM445 host target gene. LOC253959 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253959 BINDING SITE, designated SEQ ID:45509, to the nucleotide sequence of VGAM445 RNA, herein designated VGAM RNA, also designated SEQ ID:3156.

[20983] Another function of VGAM445 is therefore inhibition of LOC253959 (Accession XM\_170749). Accordingly, utilities of VGAM445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253959. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 446 (VGAM446) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20984] VGAM446 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM446 was detected is described hereinabove with reference to Figs. 1–8.

[20985] VGAM446 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Papillomavirus Type 17. VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20986] VGAM446 gene encodes a VGAM446 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM446 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM446 precursor RNA is designated SEQ ID:432, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:432 is located at position 437 relative to the genome of Human Papillomavirus Type 17.

[20987] VGAM446 precursor RNA folds onto itself, forming VGAM446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20988] An enzyme complex designated DICER COMPLEX, `dices` the VGAM446 folded precursor RNA into VGAM446 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM446 RNA is designated SEQ ID:3157, and is provided hereinbelow with reference to the sequence listing part.

[20989] VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM446 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20990] VGAM446 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM446 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM446 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[20991] The complementary binding of VGAM446 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM446 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM446 host target RNA into VGAM446 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20992] It is appreciated that VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM446 host target genes. The mRNA of each one of this plurality of VGAM446 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM446 RNA, herein designated VGAM RNA, and which when bound by VGAM446 RNA causes inhibition of translation of respective one or more VGAM446 host target proteins.

[20993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM446 gene, herein designated VGAM GENE, on one or more VGAM446 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20994] It is yet further appreciated that a function of VGAM446 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM446 include diagnosis, prevention and treatment of viral infection by Human Papillomavirus Type 17. Specific functions, and accordingly utilities, of VGAM446 correlate with, and may be deduced from, the identity of the host target genes which VGAM446 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20995] Nucleotide sequences of the VGAM446 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM446 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM446 are further described hereinbelow with reference to Table 1.

[20996] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM446 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM446 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20997] As mentioned hereinabove with reference to Fig. 1, a function of VGAM446 gene, herein designated VGAM is inhibition of expression of VGAM446 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM446 correlate with, and may be deduced from, the identity of the target genes which VGAM446 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20998] Transmembrane Protein 2 (TMEM2, Accession NM\_013390) is a VGAM446 host target gene. TMEM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMEM2, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEM2 BINDING SITE, designated SEQ ID:15041, to the nucleotide sequence of VGAM446 RNA, herein designated VGAM RNA, also designated SEQ ID:3157.

[20999] A function of VGAM446 is therefore inhibition of Transmembrane Protein 2 (TMEM2, Accession NM\_013390). Accordingly, utilities of VGAM446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM2. KIAA0660 (Accession NM\_012297) is another VGAM446 host target gene. KIAA0660 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0660 BINDING SITE, designated SEQ ID:14659, to the nucleotide sequence of VGAM446 RNA, herein designated VGAM RNA, also designated SEQ ID:3157.

[21000] Another function of VGAM446 is therefore inhibition of KIAA0660 (Accession NM\_012297). Accordingly, utilities of VGAM446 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0660. LOC219940 (Accession XM\_167791) is another VGAM446 host target gene. LOC219940 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219940 BINDING SITE, designated SEQ ID:44832, to the nucleotide sequence of VGAM446 RNA, herein designated VGAM RNA, also designated SEQ ID:3157.

[21001] Another function of VGAM446 is therefore inhibition of LOC219940 (Accession XM\_167791). Accordingly, utilities of VGAM446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219940. LOC90750 (Accession XM\_033868) is another VGAM446 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31967, to the

nucleotide sequence of VGAM446 RNA, herein designated VGAM RNA, also designated SEQ ID:3157.

[21002] Another function of VGAM446 is therefore inhibition of LOC90750 (Accession XM\_033868). Accordingly, utilities of VGAM446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 447 (VGAM447) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21003] VGAM447 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM447 was detected is described hereinabove with reference to Figs. 1–8.

[21004] VGAM447 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Papillomavirus Type 40. VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21005] VGAM447 gene encodes a VGAM447 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM447 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM447 precursor RNA is designated SEQ ID:433, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:433 is located at position 1456 relative to the genome of Human Papillomavirus Type 40.

[21006] VGAM447 precursor RNA folds onto itself, forming VGAM447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21007] An enzyme complex designated DICER COMPLEX, `dices` the VGAM447 folded precursor RNA into VGAM447 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM447 RNA is designated SEQ ID:3158, and is provided hereinbelow with reference to the sequence listing part.

[21008] VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM447 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[21009] VGAM447 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM447 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM447 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21010] The complementary binding of VGAM447 RNA, herein designated VGAM RNA, to host target binding sites on VGAM447 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM447 host target RNA into VGAM447 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21011] It is appreciated that VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM447 host target genes. The mRNA of each one of this plurality of VGAM447 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM447 RNA, herein designated VGAM RNA, and which when bound by VGAM447 RNA causes inhibition of translation of respective one or more VGAM447 host target proteins.

[21012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM447 gene, herein designated VGAM GENE, on one or more VGAM447 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[21013] It is yet further appreciated that a function of VGAM447 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of viral infection by Human Papillomavirus Type 40. Specific functions, and accordingly utilities, of VGAM447 correlate with, and may be deduced from, the identity of the host target genes which VGAM447 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21014] Nucleotide sequences of the VGAM447 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM447 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM447 are further described hereinbelow with reference to Table 1.

[21015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM447 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM447 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21016] As mentioned hereinabove with reference to Fig. 1, a function of VGAM447 gene, herein designated VGAM is inhibition of expression of VGAM447 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM447 correlate with, and may be deduced from, the identity of the target genes which VGAM447 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21017] ATPase, Na<sup>+</sup>/K<sup>+</sup> Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM\_000702) is a VGAM447 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:6363, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21018] A function of VGAM447 is therefore inhibition of ATPase,

Na<sup>+</sup>/K<sup>+</sup> Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM\_000702). Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. DNA (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NM\_013369) is another VGAM447 host target gene. DNMT3L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNMT3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3L BINDING SITE, designated SEQ ID:15015, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21019] Another function of VGAM447 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NM\_013369), a gene which plays a role in de novo methylation of CpG islands. Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3L. The function of DNMT3L has been established by previous studies. By database analysis, PCR with specific primers

based on predicted and trapped exon sequences, and screening of testis, fetal liver, placenta, and thymus mRNA and cDNA libraries, Aapola et al. (2000) isolated a cDNA encoding DNMT3L. Sequence analysis predicted that the 387-amino acid protein contains a cysteine-rich region with a novel ADD (for ATRX (OMIM Ref. No. 300032), DNMT3, and DNMT3L) C2-C2 zinc finger motif near an imperfect PHD zinc finger with C4-C4. RT-PCR analysis detected highest expression of DNMT3L in testis, followed by ovary, thymus, and fetal thymus. Northern blot analysis failed to detect expression of DNMT3L. By genomic sequence analysis, Aapola et al. (2000) determined that the DNMT3L gene contains 12 exons and spans 16 kb. The translation initiation codon is in exon 2. The authors detected a splice variant lacking exon 8. Animal model experiments lend further support to the function of DNMT3L. By disrupting homologous recombination in mouse embryonic stem cells, Bourc'his et al. (2001) generated viable but sterile mice with mutated Dnmt3l (termed Dnmt3lG) in which male testes had severe hypogonadism and a Sertoli cell-only phenotype. The heterozygous offspring of females with Dnmt3lG failed to develop past 9.5 days postcoitum due to embryonic rather than

uterine defects. Bisulfite genomic sequence analysis of the differentially methylated region (DMR) of imprinted and maternally repressed genes such as *Snrpn* (OMIM Ref. No. 182279) detected undermethylation of oocytes from *Dnmt3l*G homozygous females, showing that *Dnmt3l* is required for the establishment of maternal methylation imprints. Heterozygous embryos from *Dnmt3l*G homozygotes displayed biallelic expression of genes that are normally expressed only from the allele of paternal origin. Bourc'h et al. (2001) concluded that DNMT3L is required specifically for the establishment of genomic imprints but is dispensable for their propagation, and it is essential for the de novo methylation of single-copy DNA sequences. The authors proposed that DNMT3L is likely to function as a regulator of methylation at imprinted loci rather than a DNA cytosine methyltransferase because of a lack of catalytic motifs in its sequence.

[21020] It is appreciated that the abovementioned animal model for DNMT3L is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21021] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [21022] Aapola, U.; Shibuya, K.; Scott, H. S.; Ollila, J.; Vihinen, M.; Heino, M.; Shintani, A.; Kawasaki, K.; Minoshima, S.; Krohn, K.; Antonarakis, S. E.; Shimizu, N.; Kudoh, J.; Peterson, P. : Isolation and initial characterization of a novel zinc finger gene, DNMT3L, on 21q22.3, related to the cysteine-5-methyltransferase 3 gene family. *Genomics* 65: 293-298, 2000. ; and

- [21024] Further studies establishing the function and utilities of DNMT3L are found in John Hopkins OMIM database record ID 606588, and in cited publications numbered 6277-6278 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DXS1283E (Accession XM\_047871) is another VGAM447 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

DXS1283E BINDING SITE, designated SEQ ID:35062, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21025] Another function of VGAM447 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. Neuronal Pentraxin I (NPTX1, Accession NM\_002522) is another VGAM447 host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:8351, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21026] Another function of VGAM447 is therefore inhibition of Neuronal Pentraxin I (NPTX1, Accession NM\_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with NPTX1. The function of NPTX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.FLJ12057 (Accession NM\_024768) is another VGAM447 host target gene.

FLJ12057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12057 BINDING SITE, designated SEQ ID:24123, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21027] Another function of VGAM447 is therefore inhibition of FLJ12057 (Accession NM\_024768). Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12057. FLJ14075 (Accession NM\_024894) is another VGAM447 host target gene. FLJ14075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14075 BINDING SITE, designated SEQ ID:24374, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21028] Another function of VGAM447 is therefore inhibition of FLJ14075 (Accession NM\_024894). Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14075. SCAM-1 (Accession NM\_005775) is another VGAM447 host target gene. SCAM-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAM-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAM-1 BINDING SITE, designated SEQ ID:12349, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21029] Another function of VGAM447 is therefore inhibition of SCAM-1 (Accession NM\_005775). Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAM-1.

LOC138639 (Accession XM\_059988) is another VGAM447 host target gene. LOC138639 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC138639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138639 BINDING SITE, designated SEQ ID:37138, to the nucleotide sequence of VGAM447 RNA, herein designated VGAM RNA, also designated SEQ ID:3158.

[21030] Another function of VGAM447 is therefore inhibition of LOC138639 (Accession XM\_059988). Accordingly, utilities of VGAM447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138639. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 448 (VGAM448) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21031] VGAM448 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM448 was detected is described hereinabove with reference to Figs. 1–8.

[21032] VGAM448 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Papillomavirus Type 40. VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21033] VGAM448 gene encodes a VGAM448 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM448 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM448 precursor RNA is designated SEQ ID:434, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:434 is located at position 2267 relative to the genome of Human Papillomavirus Type 40.

[21034] VGAM448 precursor RNA folds onto itself, forming VGAM448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21035] An enzyme complex designated DICER COMPLEX, `dices` the VGAM448 folded precursor RNA into VGAM448 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM448 RNA is designated SEQ ID:3159, and is provided hereinbelow with reference to the sequence listing part.

[21036] VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM448 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21037] VGAM448 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM448 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM448 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[21038] The complementary binding of VGAM448 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM448 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM448 host target RNA into VGAM448 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21039] It is appreciated that VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM448 host target genes. The mRNA of each one of this plurality of VGAM448 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM448 RNA, herein designated VGAM RNA, and which when bound by VGAM448 RNA causes inhibition of translation of respective one or more VGAM448 host target proteins.

[21040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM448 gene, herein designated VGAM GENE, on one or more VGAM448 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21041] It is yet further appreciated that a function of VGAM448 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM448 include diagnosis, prevention and treatment of viral infection by Human Papillomavirus Type 40. Specific functions, and accordingly utilities, of VGAM448 correlate with, and may be deduced from, the identity of the host target genes which VGAM448 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21042] Nucleotide sequences of the VGAM448 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM448 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM448 are further described hereinbelow with reference to Table 1.

[21043] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM448 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM448 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21044] As mentioned hereinabove with reference to Fig. 1, a function of VGAM448 gene, herein designated VGAM is inhibition of expression of VGAM448 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM448 correlate with, and may be deduced from, the identity of the target genes which VGAM448 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21045] G Protein-coupled Receptor 30 (GPR30, Accession NM\_001505) is a VGAM448 host target gene. GPR30 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR30, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR30 BINDING SITE, designated SEQ ID:7253, to the nucleotide sequence of VGAM448 RNA, herein designated VGAM RNA, also designated SEQ ID:3159.

[21046] A function of VGAM448 is therefore inhibition of G Protein-coupled Receptor 30 (GPR30, Accession NM\_001505), a gene which receives chemical signals in cell communication in both CNS and peripheral tissues. Accordingly, utilities of VGAM448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR30. The function of GPR30 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.FLJ11273 (Accession NM\_018374) is another VGAM448 host target gene. FLJ11273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11273 BINDING SITE, designated SEQ

ID:20393, to the nucleotide sequence of VGAM448 RNA, herein designated VGAM RNA, also designated SEQ ID:3159.

[21047] Another function of VGAM448 is therefore inhibition of FLJ11273 (Accession NM\_018374). Accordingly, utilities of VGAM448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11273. FLJ12650 (Accession NM\_024522) is another VGAM448 host target gene. FLJ12650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12650 BINDING SITE, designated SEQ ID:23721, to the nucleotide sequence of VGAM448 RNA, herein designated VGAM RNA, also designated SEQ ID:3159.

[21048] Another function of VGAM448 is therefore inhibition of FLJ12650 (Accession NM\_024522). Accordingly, utilities of VGAM448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12650. KIAA0090 (Accession XM\_114045) is another VGAM448 host target gene. KIAA0090 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42648, to the nucleotide sequence of VGAM448 RNA, herein designated VGAM RNA, also designated SEQ ID:3159.

[21049] Another function of VGAM448 is therefore inhibition of KIAA0090 (Accession XM\_114045). Accordingly, utilities of VGAM448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. LOC124045 (Accession XM\_071873) is another VGAM448 host target gene. LOC124045 BINDING SITE1 through LOC124045 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC124045, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124045 BINDING SITE1 through LOC124045 BINDING SITE4, designated SEQ ID:37435, SEQ ID:37436, SEQ ID:37437 and SEQ ID:37438 respectively, to the nucleotide sequence of VGAM448

RNA, herein designated VGAM RNA, also designated SEQ ID:3159.

[21050] Another function of VGAM448 is therefore inhibition of LOC124045 (Accession XM\_071873). Accordingly, utilities of VGAM448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124045. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 449 (VGAM449) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21051] VGAM449 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM449 was detected is described hereinabove with reference to Figs. 1–8.

[21052] VGAM449 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Papillomavirus Type 7. VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21053] VGAM449 gene encodes a VGAM449 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM449 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM449 precursor RNA is designated SEQ ID:435, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:435 is located at position 5002 relative to the genome of Human Papillomavirus Type 7.

[21054] VGAM449 precursor RNA folds onto itself, forming VGAM449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21055] An enzyme complex designated DICER COMPLEX, `dices` the VGAM449 folded precursor RNA into VGAM449 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM449 RNA is designated SEQ ID:3160, and is provided hereinbelow with reference to the sequence listing part.

[21056] VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM449 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21057] VGAM449 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM449 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM449 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21058] The complementary binding of VGAM449 RNA, herein designated VGAM RNA, to host target binding sites on VGAM449 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM449 host target RNA into VGAM449 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21059] It is appreciated that VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM449 host target genes. The mRNA of each one of this plurality of VGAM449 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM449 RNA, herein designated VGAM RNA, and which when bound by VGAM449 RNA causes inhibition of translation of respective one or more VGAM449 host target proteins.

[21060] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM449 gene, herein designated VGAM GENE, on one or more VGAM449 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[21061] It is yet further appreciated that a function of VGAM449 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of viral infection by Human Papillomavirus Type 7. Specific functions, and accordingly utilities, of VGAM449 correlate with, and may be deduced from, the identity of the host target genes which VGAM449 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21062] Nucleotide sequences of the VGAM449 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM449 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM449 are further described hereinbelow with reference to Table 1.

[21063] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM449 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM449 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21064] As mentioned hereinabove with reference to Fig. 1, a function of VGAM449 gene, herein designated VGAM is inhibition of expression of VGAM449 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM449 correlate with, and may be deduced from, the identity of the target genes which VGAM449 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21065] Acyl-Coenzyme A Dehydrogenase, Long Chain (ACADL, Accession NM\_001608) is a VGAM449 host target gene. ACADL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACADL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADL BINDING SITE, designated SEQ ID:7311, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21066] A function of VGAM449 is therefore inhibition of Acyl-

Coenzyme A Dehydrogenase, Long Chain (ACADL, Accession NM\_001608). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADL. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM\_012281) is another VGAM449 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14606, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21067] Another function of VGAM449 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM\_012281), a gene which is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 has been established by previous studies. Kv4 (KCND)

proteins form voltage-activated A-type potassium ion channels and are prominent in the repolarization phase of the action potential. Zhu et al. (1999) cloned the cDNA encoding KCND2. The deduced 630-amino acid protein shares 99% sequence identity with the rat homolog and contains multiple potential phosphorylation sites as well as a membrane-spanning core region, including a P domain with the potassium channel signature GYGD, flanked by cytoplasmic hydrophilic N and C termini. Isbrandt et al. (2000) determined that KCND2 shares 60% identity and 71% homology with the KCND1 (OMIM Ref. No. 300281) and KCND3L (OMIM Ref. No. 605411) sequences, with the least conservation at the C terminus. By Northern blot analysis, Zhu et al. (1999) and Isbrandt et al. (2000) detected expression of a 6.8-kb transcript only in brain, particularly in the amygdala, caudate nucleus, cerebellum, hippocampus, substantia nigra, and thalamus. Heterologous expression determined that KCND2 mediates a rapidly inactivating, A-type outward potassium current which is not under the control of the N terminus as it is in Shaker channels (Zhu et al., 1999). Postma et al. (2000) resolved the intron-exon boundaries and flanking intron sequences of the KCND2 gene and found that it contains

6 exons. Zhu et al. (1999) mapped the KCND2 gene to chromosome 7q31–q32 by FISH. By radiation hybrid analysis, Postma et al. (2000) mapped the gene to 7q31

[21068] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21069] Isbrandt, D.; Leicher, T.; Waldschutz, R.; Zhu, X.; Luhmann, U.; Michel, U.; Sauter, K.; Pongs, O. : Gene structures and expression profiles of three human KCND (Kv4) potassium channels mediating A-type currents I(to) and I(sa). Genomics 64: 144–154, 2000. ; and

[21070] Postma, A. V.; Bezzina, C. R.; de Vries, J. F.; Wilde, A. A. M.; Moorman, A. F. M.; Mannens, M. M. A. M. : Genomic organisation and chromosomal localisation of two members of the KCND i.

[21071] Further studies establishing the function and utilities of KCND2 are found in John Hopkins OMIM database record ID 605410, and in cited publications numbered 10996–4783 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LNK (Accession NM\_005475) is another VGAM449 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:11969, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21072] Another function of VGAM449 is therefore inhibition of LNK (Accession NM\_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115. Retinoic Acid Receptor, Beta (RARβ, Accession NM\_000965) is another VGAM449 host target gene. RARβ BINDING SITE1 and RARβ BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RARβ, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RARB BINDING SITE1 and RARB BINDING SITE2, designated SEQ ID:6694 and SEQ ID:18240 respectively, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21073] Another function of VGAM449 is therefore inhibition of Retinoic Acid Receptor, Beta (RARB, Accession NM\_000965), a gene which is one member of the steroid/thyroid hormone receptor family of ligand-activated transcription factors. Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARB. The function of RARB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Cyclin M1 (CNNM1, Accession NM\_020348) is another VGAM449 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21609, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3160.

[21074] Another function of VGAM449 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM\_020348). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. FLJ11181 (Accession NM\_018350) is another VGAM449 host target gene. FLJ11181 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11181 BINDING SITE, designated SEQ ID:20363, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21075] Another function of VGAM449 is therefore inhibition of FLJ11181 (Accession NM\_018350). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11181. FLJ13576 (Accession NM\_022484) is another VGAM449 host target gene. FLJ13576 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13576, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13576 BINDING SITE, designated SEQ ID:22862, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21076] Another function of VGAM449 is therefore inhibition of FLJ13576 (Accession NM\_022484). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13576. FLJ20079 (Accession NM\_017656) is another VGAM449 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19165, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21077] Another function of VGAM449 is therefore inhibition of FLJ20079 (Accession NM\_017656). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20079. KIAA1163 (Accession XM\_086231) is another VGAM449 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1163 BINDING SITE, designated SEQ ID:38555, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21078] Another function of VGAM449 is therefore inhibition of KIAA1163 (Accession XM\_086231). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. KIAA1189 (Accession XM\_050508) is another VGAM449 host target gene. KIAA1189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1189 BINDING SITE, designated SEQ ID:35649, to the

nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21079] Another function of VGAM449 is therefore inhibition of KIAA1189 (Accession XM\_050508). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1189. LOC148166 (Accession XM\_086077) is another VGAM449 host target gene. LOC148166 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148166 BINDING SITE, designated SEQ ID:38478, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21080] Another function of VGAM449 is therefore inhibition of LOC148166 (Accession XM\_086077). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148166. LOC150596 (Accession XM\_086957) is another VGAM449 host target gene. LOC150596 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC150596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150596 BINDING SITE, designated SEQ ID:38994, to the nucleotide sequence of VGAM449 RNA, herein designated VGAM RNA, also designated SEQ ID:3160.

[21081] Another function of VGAM449 is therefore inhibition of LOC150596 (Accession XM\_086957). Accordingly, utilities of VGAM449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150596. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 450 (VGAM450) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21082] VGAM450 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM450 was detected is described hereinabove with reference to Figs. 1–8.

[21083] VGAM450 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cardamine Chlorotic Fleck Virus. VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21084] VGAM450 gene encodes a VGAM450 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM450 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM450 precursor RNA is designated SEQ ID:436, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:436 is located at position 43 relative to the genome of Cardamine Chlorotic Fleck Virus.

[21085] VGAM450 precursor RNA folds onto itself, forming VGAM450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21086] An enzyme complex designated DICER COMPLEX, `dices` the VGAM450 folded precursor RNA into VGAM450 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM450 RNA is designated SEQ ID:3161, and is provided hereinbelow with reference to the sequence listing part.

[21087] VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM450 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21088] VGAM450 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM450 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM450 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21089] The complementary binding of VGAM450 RNA, herein designated VGAM RNA, to host target binding sites on VGAM450 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM450 host tar-

get RNA into VGAM450 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21090] It is appreciated that VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM450 host target genes. The mRNA of each one of this plurality of VGAM450 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM450 RNA, herein designated VGAM RNA, and which when bound by VGAM450 RNA causes inhibition of translation of respective one or more VGAM450 host target proteins.

[21091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM450 gene, herein designated VGAM GENE, on one or more VGAM450 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21092] It is yet further appreciated that a function of VGAM450 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM450 include diagnosis, prevention and treatment of viral infection by Cardamine Chlorotic Fleck Virus. Specific functions, and accordingly utilities, of VGAM450 correlate with, and may be deduced from, the identity of the host target genes which VGAM450 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21093] Nucleotide sequences of the VGAM450 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM450 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM450 are further

described hereinbelow with reference to Table 1.

[21094] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM450 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM450 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21095] As mentioned hereinabove with reference to Fig. 1, a function of VGAM450 gene, herein designated VGAM is inhibition of expression of VGAM450 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM450 correlate with, and may be deduced from, the identity of the target genes which VGAM450 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21096] Collagen, Type V, Alpha 1 (COL5A1, Accession NM\_000093) is a VGAM450 host target gene. COL5A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by COL5A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of COL5A1 BINDING SITE, designated SEQ ID:5556, to the nucleotide sequence of VGAM450 RNA, herein designated VGAM RNA, also designated SEQ ID:3161.

[21097] A function of VGAM450 is therefore inhibition of Collagen, Type V, Alpha 1 (COL5A1, Accession NM\_000093). Accordingly, utilities of VGAM450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL5A1. Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878) is another VGAM450 host target gene. IL2RB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL2RB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RB BINDING SITE, designated SEQ ID:6574, to the nucleotide sequence of VGAM450 RNA, herein designated VGAM RNA, also designated SEQ ID:3161.

[21098] Another function of VGAM450 is therefore inhibition of Interleukin 2 Receptor, Beta (IL2RB, Accession NM\_000878), a gene which is involved in receptor mediated endocytosis and transduces the mitogenic signals of il-2. Accordingly, utilities of VGAM450 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with IL2RB. The function of IL2RB has been established by previous studies. Kondo et al. (2000) showed that a clonogenic common lymphoid progenitor, a bone marrow-resident cell that gives rise exclusively to lymphocytes (T, B, and natural killer cells), can be redirected to the myeloid lineage by stimulation through exogenously expressed interleukin-2 receptor and GM-CSF receptor (138981, 306250). Analysis of mutants of the beta chain of the IL2 receptor revealed that the granulocyte and monocyte differentiation signals are triggered by different cytoplasmic domains, showing that the signaling pathways responsible for these unique developmental outcomes are separable. Finally, Kondo et al. (2000) showed that the endogenous myelomonocytic cytokine receptors for GM-CSF and macrophage colony-stimulating factor (CSF1R; 164770) are expressed at low to moderate levels on the more primitive hematopoietic stem cells, are absent on common lymphoid progenitors, and are upregulated after myeloid lineage induction by IL2 (OMIM Ref. No. 147680). Kondo et al. (2000) concluded that cytokine signaling can regulate cell fate decisions and proposed that a critical step in lymphoid commitment is downregulation

lation of cytokine receptors that drive myeloid cell development Yang et al. (2001) analyzed T-cell subsets and levels of cytokine IL2 and soluble IL2 receptor in the peripheral blood of patients with normal pressure glaucoma (NPG; 606657) and primary open angle glaucoma (POAG; 137760) and compared them to age-matched controls. They found increased frequency of CD8<sup>+</sup>/HLA-DR<sup>+</sup> lymphocytes in patients with NPG and increased CD3<sup>+</sup>/CD8<sup>+</sup> lymphocytes in both NPG and POAG patients. CD5<sup>+</sup> lymphocytes were higher only in POAG patients. The mean concentration of soluble IL2R was higher in NPG and POAG patients than in controls although the IL2 concentration was similar in patients and controls. The authors concluded that the immune system might play an important role in initiation or progression of glaucomatous optic neuropathy in some patients Animal model experiments lend further support to the function of IL2RB. Suzuki et al. (1995) generated mice defective in Il2rb expression by insertion of a neomycin resistance cassette into the IL2RB gene at exon 6, which encodes a region of the extracellular domain proximal to the transmembrane region. Mice from 2 independent embryonic stem cell lines were separately bred homozygous for the defect, with both lineages

showing identical gross appearances. The mice showed normal growth until approximately 3 weeks after birth. After 4 weeks of age, they were generally smaller than normal or heterozygous littermates and had abnormal appearances characterized by fuzzy hair, slow movement, and fully developed external genitals. Death occurred at approximately 12 weeks. In mice lacking the IL2R beta chain, T cells were shown to be spontaneously activated, resulting in exhaustive differentiation of B cells into plasma cells and the appearance of high serum concentrations of immunoglobulins G1 and E, as well as autoantibodies that cause hemolytic anemia. Marked infiltrated granulocytopoiesis was also apparent. Depletion of CD4+ T cells in mutant mice rescued B cells without reversion of granulocyte abnormalities. T cells did not proliferate in response to polyclonal activators, nor could antigen-specific immune responses be elicited. Thus, Suzuki et al. (1995) concluded that Il2rb is required to keep the activation programs of T cells under control, to maintain homeostasis, and to prevent autoimmunity

[21099] It is appreciated that the abovementioned animal model for IL2RB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[21100] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21101] Kondo, M.; Scherer, D. C.; Miyamoto, T.; King, A. G.; Akashi, K.; Sugamura, K.; Weissman, I. L. : Cell-fate conversion of lymphoid-committed progenitors by instructive actions of cytokines. Nature 407: 383–386, 2000. ; and

[21102] Suzuki, H.; Kundig, T. M.; Furlonger, C.; Wakeham, A.; Timms, E.; Matsuyama, T.; Schmits, R.; Simard, J. J. L.; Ohashi, P. S.; Griesser, H.; Taniguchi, T.; Paige, C. J.; Mak, T. W. : De.

[21103] Further studies establishing the function and utilities of IL2RB are found in John Hopkins OMIM database record ID 146710, and in sited publications numbered 11979, 12006–12008, 4333, 12009–1201 and 386 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM\_045343) is another VGAM450 host target gene. NBS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBS1 BINDING SITE, designated SEQ ID:34438, to the nucleotide sequence of VGAM450 RNA, herein designated VGAM RNA, also designated SEQ ID:3161.

[21104] Another function of VGAM450 is therefore inhibition of Nijmegen Breakage Syndrome 1 (nibrin) (NBS1, Accession XM\_045343), a gene which may be involved in repair of DNA double-strand breaks. Accordingly, utilities of VGAM450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBS1. The function of NBS1 has been established by previous studies. Nijmegen breakage syndrome (NBS; 251260) is an autosomal recessive chromosomal instability syndrome characterized by microcephaly, growth retardation, immunodeficiency, and cancer predisposition. Cells from NBS patients are hypersensitive to ionizing radiation with cytogenetic features indistinguishable from those of ataxia-telangiectasia (AT; 208900). Varon et al. (1998) described the positional cloning of a gene encoding a novel protein, termed nibrin, that mapped within a 300-kb NBS critical interval on chromosome 8q21. The gene, designated NBS1, spans over 50 kb and contains 16

exons. Northern blot analysis revealed mRNA transcripts of 2.4 and 4.4 kb in all tissues examined. The predicted 754-amino acid protein contains 2 domains found in cell cycle checkpoint proteins, a forkhead-associated domain and an adjacent breast cancer carboxy-terminal domain. Varon et al. (1998) identified a truncating 5-bp deletion (602667.0001) in the majority of NBS patients studied, all of whom carried a conserved marker haplotype. Five additional truncating mutations were identified in patients with other distinct haplotypes. The domains found in nibrin and the NBS phenotype suggest that this disorder is caused by defective responses to DNA double-strand breaks (DSB). Animal model experiments lend further support to the function of NBS1. Zhu et al. (2001) generated mice deficient in NBS1 by targeted disruption. Nbs1  $-/-$  mice suffered early embryonic lethality and had poorly developed embryonic and extraembryonic tissues. Blastocysts showed greatly diminished expansion of the inner cell mass in culture, suggesting that NBS1 mediates essential functions during proliferation in the absence of externally induced damage. Zhu et al. (2001) concluded that the complex phenotypes observed in NBS patients and cell lines may not result from a complete inactivation

of NBS1 but may instead result from hypomorphic truncation mutations compatible with cell viability.

[21105] It is appreciated that the abovementioned animal model for NBS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21106] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21107] Varon, R.; Vissinga, C.; Platzer, M.; Cerosaletti, K. M.; Chrzanowska, K. H.; Saar, K.; Beckmann, G.; Seemanova, E.; Cooper, P. R.; Nowak, N. J.; Stumm, M.; Weemaes, C. M. R.; Gatti, R. A.; Wilson, R. K.; Digweed, M.; Rosenthal, A.; Sperling, K.; Concannon, P.; Reis, A. : Nibrin, a novel DNA double-strand break repair protein, is mutated in Nijmegen breakage syndrome. Cell 93: 467-476, 1998. ; and

[21108] Zhu, J.; Petersen, S.; Tessarollo, L.; Nussenzweig, A. : Targeted disruption of the Nijmegen breakage syndrome gene NBS1 leads to early embryonic lethality in mice. Curr. Biol. 11: 105-.

[21109] Further studies establishing the function and utilities of NBS1 are found in John Hopkins OMIM database record ID

602667, and in cited publications numbered 5918, 9233, 1551, 5919–5923, 9131, 8755–8756, 9438, 8757–8759, 714 and 8747 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet-activating Factor Receptor (PTAFR, Accession NM\_000952) is another VGAM450 host target gene. PTAFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTAFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTAFR BINDING SITE, designated SEQ ID:6658, to the nucleotide sequence of VGAM450 RNA, herein designated VGAM RNA, also designated SEQ ID:3161.

[21110] Another function of VGAM450 is therefore inhibition of Platelet-activating Factor Receptor (PTAFR, Accession NM\_000952), a gene which is a platelet-activating factor receptor. Accordingly, utilities of VGAM450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTAFR. The function of PTAFR has been established by previous studies. Platelet-activating factor (PAF) has been implicated as a mediator in diverse pathologic processes, such as allergy, asthma,

septic shock, arterial thrombosis, and inflammatory processes (Prescott et al., 1990). PAF is a phospholipid (1-O-alkyl-2-acetyl-sn-glycero-3-phosphorylcholine) and exerts its various effects via specific cell surface receptors that bind PAF with high affinity. Using a guinea pig probe, Seyfried et al. (1992) isolated the gene for human PAF receptor (PTAFR). The coding sequence contains no introns. The encoded protein is highly homologous to the guinea pig PAF receptor (82% identity) and contains 7 putative transmembrane domains. The PAF receptor therefore appears to be a member of the G protein-coupled family of receptors and exhibits significant similarity to many members of this family. By analysis of rodent/human somatic cell hybrids, Seyfried et al. (1992) concluded that the PTAFR gene is located on human chromosome 1. Chase et al. (1996) used fluorescence in situ hybridization to localize PTAFR to 1p35-p34.3.

[21111] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21112] Prescott, S. M.; Zimmerman, G. A.; McIntyre, T. M. : Platelet-activating factor. J. Biol. Chem. 265: 17381-17384, 1990. ; and

[21113] Seyfried, C. E.; Schweickart, V. L.; Godiska, R.; Gray, P. W. :  
The human platelet-activating factor receptor gene  
(PTAFR) contains no introns and maps to chromosome 1.  
Genomics 13: 832.

[21114] Further studies establishing the function and utilities of  
PTAFR are found in John Hopkins OMIM database record  
ID 173393, and in cited publications numbered  
3523–3525 listed in the bibliography section hereinbelow,  
which are also hereby incorporated by refer-  
ence. AF020591 (Accession NM\_014480) is another  
VGAM450 host target gene. AF020591 BINDING SITE is  
HOST TARGET binding site found in the 3` untranslated  
region of mRNA encoded by AF020591, corresponding to  
a HOST TARGET binding site such as BINDING SITE I,  
BINDING SITE II or BINDING SITE III. Table 2 illustrates the  
complementarity of the nucleotide sequences of  
AF020591 BINDING SITE, designated SEQ ID:15826, to the  
nucleotide sequence of VGAM450 RNA, herein designated  
VGAM RNA, also designated SEQ ID:3161.

[21115] Another function of VGAM450 is therefore inhibition of  
AF020591 (Accession NM\_014480). Accordingly, utilities  
of VGAM450 include diagnosis, prevention and treatment  
of diseases and clinical conditions associated with

AF020591. Inositol 1,3,4-triphosphate 5/6 Kinase (ITPK1, Accession NM\_014216) is another VGAM450 host target gene. ITPK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ITPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPK1 BINDING SITE, designated SEQ ID:15481, to the nucleotide sequence of VGAM450 RNA, herein designated VGAM RNA, also designated SEQ ID:3161.

[21116] Another function of VGAM450 is therefore inhibition of Inositol 1,3,4-triphosphate 5/6 Kinase (ITPK1, Accession NM\_014216). Accordingly, utilities of VGAM450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPK1. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM\_014644) is another VGAM450 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ

ID:16052, to the nucleotide sequence of VGAM450 RNA, herein designated VGAM RNA, also designated SEQ ID:3161.

- [21117] Another function of VGAM450 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM\_014644). Accordingly, utilities of VGAM450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 451 (VGAM451) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [21118] VGAM451 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM451 was detected is described hereinabove with reference to Figs. 1–8.
- [21119] VGAM451 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cardamine Chlorotic Fleck Virus. VGAM451 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21120] VGAM451 gene encodes a VGAM451 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM451 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM451 precursor RNA is designated SEQ ID:437, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:437 is located at position 694 relative to the genome of Carmine Chlorotic Fleck Virus.

[21121] VGAM451 precursor RNA folds onto itself, forming VGAM451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21122] An enzyme complex designated DICER COMPLEX, `dices` the VGAM451 folded precursor RNA into VGAM451 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM451 RNA is designated SEQ ID:3162, and is provided hereinbelow with reference to the sequence listing part.

[21123] VGAM451 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM451 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21124] VGAM451 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM451 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM451 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21125] The complementary binding of VGAM451 RNA, herein designated VGAM RNA, to host target binding sites on VGAM451 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM451 host target RNA into VGAM451 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21126] It is appreciated that VGAM451 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM451 host target genes. The mRNA of each one of this plurality of VGAM451 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM451 RNA, herein designated VGAM RNA, and which when bound by VGAM451 RNA causes inhibition of translation of respective one or more VGAM451 host target proteins.

[21127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM451 gene, herein designated VGAM GENE, on one or more VGAM451 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[21128] It is yet further appreciated that a function of VGAM451 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM451 include diagnosis, prevention and treatment of viral infection by Cardamine Chlorotic Fleck Virus. Specific functions, and accordingly utilities, of VGAM451 correlate with, and may be deduced from, the identity of the host target genes which VGAM451 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21129] Nucleotide sequences of the VGAM451 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM451 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM451 are further described hereinbelow with reference to Table 1.

[21130] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM451 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM451 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21131] As mentioned hereinabove with reference to Fig. 1, a function of VGAM451 gene, herein designated VGAM is inhibition of expression of VGAM451 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM451 correlate with, and may be deduced from, the identity of the target genes which VGAM451 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21132] Diacylglycerol Kinase, Gamma 90kDa (DGKG, Accession NM\_001346) is a VGAM451 host target gene. DGKG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKG BINDING SITE, designated SEQ ID:7025, to the nucleotide sequence of VGAM451 RNA, herein designated VGAM RNA, also designated SEQ ID:3162.

[21133] A function of VGAM451 is therefore inhibition of Diacyl-

glycerol Kinase, Gamma 90kDa (DGKG, Accession NM\_001346), a gene which may convert diacylglycerol to phosphatidic acid. Accordingly, utilities of VGAM451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKG. The function of DGKG has been established by previous studies. Kai et al. (1994) used degenerate PCR to clone a novel DGK, termed DGK-gamma, from HepG2 human hepatoma mRNA. They subsequently cloned a full-length cDNA from a HepG2 cDNA library. Sequence analysis revealed that DGK-gamma encodes a polypeptide of 791 amino acids which is 52% similar to that of DGK-alpha (DAGK1; 125855) and 62% similar to that of DGK-beta (OMIM Ref. No. 604070). All 3 DGK isozymes contain 2 conserved EF-hand calcium-binding motifs and 2 zinc finger domains. They also noted that some cDNAs contained a 25-amino acid truncation, which the authors presumed to be an alternate splicing variant. Both the full-length and truncated transcripts are present in a range of human tissues, with greatest expression observed in retina. When expressed in COS-7 cells, Kai et al. (1994) observed that full-length, but not truncated, DGK-gamma gave DGK activity. This activity was phosphatidylserine-dependent and had no

apparent specificity with regard to the acyl group. Kai et al. (1994) showed that DAGK3 is expressed predominantly in the human retina. Mutations in the gene encoding an eye-specific diacylglycerol kinase (DGK2) are known to cause retinal degeneration A (rdgA) in *Drosophila melanogaster* (Masai et al., 1993). Based on these findings, Stohr et al. (1999) reasoned that DAGK3 might be an excellent candidate gene for a human eye disease. They found that the human DAGK3 gene spans over 30 kb of genomic DNA interrupted by 23 introns. By FISH, they mapped the DAGK3 locus to 3q27–q28, overlapping the chromosomal region known to contain the gene (OPA1; 605290) underlying dominant optic atrophy (OMIM Ref. No. 165500), the most common form of hereditary atrophy of the optic nerve. Mutational analysis of the entire coding region of DAGK3 in 19 unrelated German optic atrophy-1 patients did not reveal any disease-causing mutations, thus excluding DAGK3 as a major cause underlying optic atrophy-1.

[21134] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21135] Kai, M.; Sakane, F.; Imai, S.; Wada, I.; Kanoh, H. : Molecular

cloning of a diacylglycerol kinase isozyme predominantly expressed in human retina with a truncated and inactive enzyme expression in most other human cells. J. Biol. Chem. 269: 18492–18498, 1994. ; and

[21136] Stohr, H.; Klein, J.; Gehrig, A.; Koehler, M. R.; Jurklies, B.; Kellner, U.; Leo-Kottler, B.; Schmid, M.; Weber, B. H. F. : Mapping and genomic characterization of the gene encoding diac.

[21137] Further studies establishing the function and utilities of DGKG are found in John Hopkins OMIM database record ID 601854, and in cited publications numbered 1266–1268 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ13955 (Accession NM\_024759) is another VGAM451 host target gene. FLJ13955 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13955 BINDING SITE, designated SEQ ID:24108, to the nucleotide sequence of VGAM451 RNA, herein designated VGAM RNA, also designated SEQ ID:3162.

[21138] Another function of VGAM451 is therefore inhibition of FLJ13955 (Accession NM\_024759). Accordingly, utilities of VGAM451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13955. KIAA0356 (Accession XM\_038655) is another VGAM451 host target gene. KIAA0356 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0356 BINDING SITE, designated SEQ ID:32890, to the nucleotide sequence of VGAM451 RNA, herein designated VGAM RNA, also designated SEQ ID:3162.

[21139] Another function of VGAM451 is therefore inhibition of KIAA0356 (Accession XM\_038655). Accordingly, utilities of VGAM451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0356. RASD Family, Member 2 (RASD2, Accession NM\_014310) is another VGAM451 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15598, to the nucleotide sequence of VGAM451 RNA, herein designated VGAM RNA, also designated SEQ ID:3162.

[21140] Another function of VGAM451 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM\_014310). Accordingly, utilities of VGAM451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 452 (VGAM452) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21141] VGAM452 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM452 was detected is described hereinabove with reference to Figs. 1–8.

[21142] VGAM452 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cardamine Chlorotic

Fleck Virus. VGAM452 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21143] VGAM452 gene encodes a VGAM452 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM452 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM452 precursor RNA is designated SEQ ID:438, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:438 is located at position 2170 relative to the genome of Car-damine Chlorotic Fleck Virus.

[21144] VGAM452 precursor RNA folds onto itself, forming VGAM452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21145] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM452 folded precursor RNA into VGAM452 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM452 RNA is designated SEQ ID:3163, and is provided hereinbelow with reference to the sequence listing part.

[21146] VGAM452 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM452 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21147] VGAM452 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM452 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM452 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[21148] The complementary binding of VGAM452 RNA, herein designated VGAM RNA, to host target binding sites on VGAM452 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM452 host target RNA into VGAM452 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21149] It is appreciated that VGAM452 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM452 host target genes. The mRNA of each one of this plurality of VGAM452 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM452 RNA, herein designated VGAM RNA, and which when bound by VGAM452 RNA causes inhibition of translation of respective one or more VGAM452 host target proteins.

[21150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM452 gene, herein designated VGAM GENE, on one or more VGAM452 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21151] It is yet further appreciated that a function of VGAM452 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM452 include diagnosis, prevention and treatment of viral infection by Cardamine Chlorotic Fleck Virus. Specific functions, and accordingly utilities, of VGAM452 correlate with, and may be deduced from, the identity of the host target genes which VGAM452 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21152] Nucleotide sequences of the VGAM452 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM452 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM452 are further described hereinbelow with reference to Table 1.

- [21153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM452 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM452 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21154] As mentioned hereinabove with reference to Fig. 1, a function of VGAM452 gene, herein designated VGAM is inhibition of expression of VGAM452 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM452 correlate with, and may be deduced from, the identity of the target genes which VGAM452 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [21155] TRIP15 (Accession NM\_004236) is a VGAM452 host target gene. TRIP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP15 BINDING SITE, designated SEQ ID:10430, to the nucleotide sequence of VGAM452 RNA,

herein designated VGAM RNA, also designated SEQ ID:3163.

[21156] A function of VGAM452 is therefore inhibition of TRIP15 (Accession NM\_004236), a gene which is a subunit of the COP9 signalosome complex. Accordingly, utilities of VGAM452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP15. The function of TRIP15 has been established by previous studies. TRIP15, or SGN2, is part of a 450-kD signalosome complex that includes COPS3 (OMIM Ref. No. 604665), COPS5 (OMIM Ref. No. 604850), GPS1 (OMIM Ref. No. 601934), and at least 4 other subunits. By autoradiographic analysis, Seeger et al. (1998) showed that the complex phosphorylates JUN (OMIM Ref. No. 165160), IKBA (OMIM Ref. No. 164008), and the C-terminal part of the p105 precursor of NFkB (OMIM Ref. No. 164011). The 26S proteasome is not a phosphorylation target, although immunofluorescence microscopy demonstrated that the 450-kD complex has a cytosolic localization, concentrated around the nucleus. Some nuclear hormone receptors (NHRs) silence gene expression in the absence of hormone. Corepressors, which are bound to the silencing domain of NHRs and are involved in the repression of

gene expression, dissociate upon hormone binding, leading to the binding of coactivators that mediate gene activation. TR is a transcriptional silencer in the absence of hormone as well as a hormone-dependent trans-activator, with its silencing domain localized in the C terminus.

Dressel et al. (1999) obtained a full-length HeLa cell cDNA encoding TRIP15, the human homolog of the *Drosophila* corepressor 'Alien.' Sequence analysis predicted that the 305-amino acid TRIP15 protein, which is 90% identical and 95% similar to *Drosophila* Alien, contains an acidic region in the N terminus, a putative zinc finger in the C terminus, and a central hydrophobic core region flanked by 2 putative alpha-helical structures and a nuclear localization signal. Western blot analysis determined that TRIP15 is expressed as a 41-kD protein. Yeast 2-hybrid, GST pull-down, and coimmunoprecipitation analyses showed that TRIP15 interacts with the C terminus of TR, but not with intact RAR (OMIM Ref. No. 180240), only in the absence of hormone. Immunofluorescence microscopy demonstrated that TRIP15 is localized in the nucleus. Reporter assays indicated that TRIP15 increases receptor-mediated silencing and harbors an autonomous silencing function, which correlates with the ability of TRIP15 to interact with TR in

both the hinge region and the C-terminal end of the TR silencing domain.

[21157] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21158] Seeger, M.; Kraft, R.; Ferrell, K.; Dawadschargal, B.-O.; Dumdey, R.; Schade, R.; Gordon, C.; Naumann, M.; Dubiel, W. : A novel protein complex involved in signal transduction possessing similarities to 26S proteasome subunits. FASEB J. 12: 469-478, 1998. ; and

[21159] Dressel, U.; Thormeyer, D.; Altincicek, B.; Paululat, A.; Egger, M.; Schneider, S.; Tenbaum, S. P.; Renkawitz, R.; Baniahmad, A. : Alien, a highly conserved protein with characteristics of.

[21160] Further studies establishing the function and utilities of TRIP15 are found in John Hopkins OMIM database record ID 604508, and in cited publications numbered 544 and 6199-5445 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10901 (Accession NM\_018265) is another VGAM452 host target gene. FLJ10901 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10901, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10901 BINDING SITE, designated SEQ ID:20234, to the nucleotide sequence of VGAM452 RNA, herein designated VGAM RNA, also designated SEQ ID:3163.

[21161] Another function of VGAM452 is therefore inhibition of FLJ10901 (Accession NM\_018265). Accordingly, utilities of VGAM452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10901. GW112 (Accession NM\_006418) is another VGAM452 host target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:13133, to the nucleotide sequence of VGAM452 RNA, herein designated VGAM RNA, also designated SEQ ID:3163.

[21162] Another function of VGAM452 is therefore inhibition of GW112 (Accession NM\_006418). Accordingly, utilities of VGAM452 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GW112. KIAA0976 (Accession NM\_014917) is another VGAM452 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17166, to the nucleotide sequence of VGAM452 RNA, herein designated VGAM RNA, also designated SEQ ID:3163.

[21163] Another function of VGAM452 is therefore inhibition of KIAA0976 (Accession NM\_014917). Accordingly, utilities of VGAM452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976. LOC245771 (Accession XM\_167366) is another VGAM452 host target gene. LOC245771 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:44639, to

the nucleotide sequence of VGAM452 RNA, herein designated VGAM RNA, also designated SEQ ID:3163.

[21164] Another function of VGAM452 is therefore inhibition of LOC245771 (Accession XM\_167366). Accordingly, utilities of VGAM452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245771. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 453 (VGAM453) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21165] VGAM453 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM453 was detected is described hereinabove with reference to Figs. 1–8.

[21166] VGAM453 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Borna Disease Virus. VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21167] VGAM453 gene encodes a VGAM453 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM453 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM453 precursor RNA is designated SEQ ID:439, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:439 is located at position 5441 relative to the genome of Borna Disease Virus.

[21168] VGAM453 precursor RNA folds onto itself, forming VGAM453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21169] An enzyme complex designated DICER COMPLEX, `dices` the VGAM453 folded precursor RNA into VGAM453 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM453 RNA is designated SEQ ID:3164, and is provided hereinbelow with reference to the sequence listing part.

[21170] VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM453 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[21171] VGAM453 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM453 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM453 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21172] The complementary binding of VGAM453 RNA, herein designated VGAM RNA, to host target binding sites on VGAM453 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM453 host target RNA into VGAM453 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21173] It is appreciated that VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM453 host target genes. The mRNA of each one of this plurality of VGAM453 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM453 RNA, herein designated VGAM RNA, and which when bound by VGAM453 RNA causes inhibition of translation of respective one or more VGAM453 host target proteins.

[21174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM453 gene, herein designated VGAM GENE, on one or more VGAM453 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[21175] It is yet further appreciated that a function of VGAM453 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM453 include diagnosis, prevention and treatment of viral infection by Borna Disease Virus. Specific functions, and accordingly utilities, of VGAM453 correlate with, and may be deduced from, the identity of the host target genes which VGAM453 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21176] Nucleotide sequences of the VGAM453 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM453 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM453 are further described hereinbelow with reference to Table 1.

[21177] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM453 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM453 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21178] As mentioned hereinabove with reference to Fig. 1, a function of VGAM453 gene, herein designated VGAM is inhibition of expression of VGAM453 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM453 correlate with, and may be deduced from, the identity of the target genes which VGAM453 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21179] Aldehyde Dehydrogenase 3 Family, Member B2 (ALDH3B2, Accession NM\_000695) is a VGAM453 host target gene. ALDH3B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH3B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3B2 BINDING SITE, designated SEQ ID:6355, to the nucleotide sequence of VGAM453 RNA, herein designated VGAM RNA, also designated SEQ ID:3164.

[21180] A function of VGAM453 is therefore inhibition of Aldehyde

Dehydrogenase 3 Family, Member B2 (ALDH3B2, Accession NM\_000695), a gene which may play a role in alcohol detoxitation. Accordingly, utilities of VGAM453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3B2. The function of ALDH3B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251.FLJ20813 (Accession NM\_017961) is another VGAM453 host target gene. FLJ20813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20813 BINDING SITE, designated SEQ ID:19677, to the nucleotide sequence of VGAM453 RNA, herein designated VGAM RNA, also designated SEQ ID:3164.

[21181] Another function of VGAM453 is therefore inhibition of FLJ20813 (Accession NM\_017961). Accordingly, utilities of VGAM453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20813. LOC149650 (Accession XM\_086623) is another VGAM453

host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:38795, to the nucleotide sequence of VGAM453 RNA, herein designated VGAM RNA, also designated SEQ ID:3164.

[21182] Another function of VGAM453 is therefore inhibition of LOC149650 (Accession XM\_086623). Accordingly, utilities of VGAM453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. LOC150397 (Accession XM\_086907) is another VGAM453 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38958, to the nucleotide sequence of VGAM453 RNA, herein designated VGAM RNA, also designated SEQ ID:3164.

[21183] Another function of VGAM453 is therefore inhibition of LOC150397 (Accession XM\_086907). Accordingly, utilities of VGAM453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC161823 (Accession XM\_091156) is another VGAM453 host target gene. LOC161823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161823 BINDING SITE, designated SEQ ID:40029, to the nucleotide sequence of VGAM453 RNA, herein designated VGAM RNA, also designated SEQ ID:3164.

[21184] Another function of VGAM453 is therefore inhibition of LOC161823 (Accession XM\_091156). Accordingly, utilities of VGAM453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161823. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 454 (VGAM454) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[21185] VGAM454 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM454 was detected is described hereinabove with reference to Figs. 1–8.

[21186] VGAM454 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Borna Disease Virus. VGAM454 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21187] VGAM454 gene encodes a VGAM454 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM454 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM454 precursor RNA is designated SEQ ID:440, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:440 is located at position 8313 relative to the genome of Borna Disease Virus.

[21188] VGAM454 precursor RNA folds onto itself, forming VGAM454 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[21189] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM454 folded precursor RNA into VGAM454 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 81%) nucleotide se-  
quence of VGAM454 RNA is designated SEQ ID:3165, and  
is provided hereinbelow with reference to the sequence  
listing part.

[21190] VGAM454 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM454 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM454 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21191] VGAM454 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM454 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM454 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21192] The complementary binding of VGAM454 RNA, herein designated VGAM RNA, to host target binding sites on VGAM454 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM454 host target RNA into VGAM454 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21193] It is appreciated that VGAM454 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM454 host target genes. The mRNA of each one of this plurality of VGAM454 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM454 RNA, herein designated VGAM RNA, and which when bound by VGAM454 RNA causes inhibition of translation of respective one or more VGAM454 host target proteins.

[21194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM454 gene, herein designated VGAM GENE, on one or more VGAM454 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21195] It is yet further appreciated that a function of VGAM454 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM454 include diagnosis, prevention and treatment of viral infection by Borna Disease Virus. Specific functions, and accordingly utilities, of VGAM454 correlate with, and may be deduced from, the identity of the host target genes which VGAM454 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [21196] Nucleotide sequences of the VGAM454 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM454 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM454 are further described hereinbelow with reference to Table 1.
- [21197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM454 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM454 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21198] As mentioned hereinabove with reference to Fig. 1, a function of VGAM454 gene, herein designated VGAM is inhibition of expression of VGAM454 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM454 correlate with, and may be deduced from, the identity of the target genes which VGAM454 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21199] LNK (Accession NM\_005475) is a VGAM454 host target gene. LNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNK BINDING SITE, designated SEQ ID:11971, to the nucleotide sequence of VGAM454 RNA, herein designated VGAM RNA, also designated SEQ ID:3165.

[21200] A function of VGAM454 is therefore inhibition of LNK (Accession NM\_005475), a gene which links T-cell receptor activation signal to phospholipase c-gamma-1, grb-2 and phosphatidylinositol 3-kinase (by similarity). Accordingly, utilities of VGAM454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNK. The function of LNK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM115.KIAA0265 (Accession XM\_045954) is another VGAM454 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34618, to the nucleotide sequence of VGAM454 RNA, herein designated VGAM RNA, also designated SEQ ID:3165.

[21201] Another function of VGAM454 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA0960 (Accession XM\_166543) is another VGAM454 host target gene. KIAA0960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:44519, to the nucleotide sequence of VGAM454 RNA, herein designated VGAM RNA, also designated SEQ ID:3165.

[21202] Another function of VGAM454 is therefore inhibition of KIAA0960 (Accession XM\_166543). Accordingly, utilities of VGAM454 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0960. LOC138428 (Accession XM\_059972) is another VGAM454 host target gene. LOC138428 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138428 BINDING SITE, designated SEQ ID:37133, to the nucleotide sequence of VGAM454 RNA, herein designated VGAM RNA, also designated SEQ ID:3165.

[21203] Another function of VGAM454 is therefore inhibition of LOC138428 (Accession XM\_059972). Accordingly, utilities of VGAM454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138428. LOC152048 (Accession XM\_098158) is another VGAM454 host target gene. LOC152048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152048 BINDING SITE, designated SEQ ID:41427, to

the nucleotide sequence of VGAM454 RNA, herein designated VGAM RNA, also designated SEQ ID:3165.

[21204] Another function of VGAM454 is therefore inhibition of LOC152048 (Accession XM\_098158). Accordingly, utilities of VGAM454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152048. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 455 (VGAM455) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21205] VGAM455 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM455 was detected is described hereinabove with reference to Figs. 1–8.

[21206] VGAM455 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Borna Disease Virus. VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21207] VGAM455 gene encodes a VGAM455 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM455 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM455 precursor RNA is designated SEQ ID:441, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:441 is located at position 5801 relative to the genome of Borna Disease Virus.

[21208] VGAM455 precursor RNA folds onto itself, forming VGAM455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21209] An enzyme complex designated DICER COMPLEX, `dices` the VGAM455 folded precursor RNA into VGAM455 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM455 RNA is designated SEQ ID:3166, and is provided hereinbelow with reference to the sequence listing part.

[21210] VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM455 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[21211] VGAM455 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM455 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM455 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21212] The complementary binding of VGAM455 RNA, herein designated VGAM RNA, to host target binding sites on VGAM455 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM455 host target RNA into VGAM455 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21213] It is appreciated that VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM455 host target genes. The mRNA of each one of this plurality of VGAM455 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM455 RNA, herein designated VGAM RNA, and which when bound by VGAM455 RNA causes inhibition of translation of respective one or more VGAM455 host target proteins.

[21214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM455 gene, herein designated VGAM GENE, on one or more VGAM455 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[21215] It is yet further appreciated that a function of VGAM455 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM455 include diagnosis, prevention and treatment of viral infection by Borna Disease Virus. Specific functions, and accordingly utilities, of VGAM455 correlate with, and may be deduced from, the identity of the host target genes which VGAM455 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21216] Nucleotide sequences of the VGAM455 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM455 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM455 are further described hereinbelow with reference to Table 1.

[21217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM455 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM455 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21218] As mentioned hereinabove with reference to Fig. 1, a function of VGAM455 gene, herein designated VGAM is inhibition of expression of VGAM455 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM455 correlate with, and may be deduced from, the identity of the target genes which VGAM455 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21219] EphB3 (EPHB3, Accession NM\_004443) is a VGAM455 host target gene. EPHB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB3 BINDING SITE, designated SEQ ID:10737, to the nucleotide sequence of VGAM455 RNA, herein designated VGAM RNA, also designated SEQ ID:3166.

[21220] A function of VGAM455 is therefore inhibition of EphB3 (EPHB3, Accession NM\_004443), a gene which receptor for

members of the ephrin-b family. binds to ephrin-b1 and -b2. Accordingly, utilities of VGAM455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB3. The function of EPHB3 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins. Bohme et al. (1993) used PCR to isolate a novel protein tyrosine kinase (PTK), which they termed HEK2 for 'human embryo kinase-2,' from a human embryonic cDNA library. Sequence analysis revealed that HEK2 encodes a 998-amino acid polypeptide having a single putative transmembrane domain, a secretory signal sequence, and 2 fibronectin repeats. Based on sequence homology, Bohme et al. (1993) stated that HEK2 is a member of the EPH/ELK family of tyrosine kinases. Northern blot analysis revealed that HEK2 was expressed as a variable 4.6-kb message in all adult human tissues tested. Southern blot analysis suggested that HEK2 is a single-copy gene in the human genome. Bohme et al. (1993) used PCR of human-mouse hybrids to map the HEK2 gene to human chromosome 3q21-qter. Bohme et al. (1996) presented evidence that HEK2 interacts with 2 ligands of EPH-related kinases (LERKs), namely, LERK2 (EFNB1; 300035) and LERK5

(EFNB2; 600527). They reported that coincubation of HEK2- and LERK2-expressing cells induces cell-cell adhesion and aggregation. Additionally, coexpression of HEK2 and LERK2 results in reduced kinase activity of HEK2. Halford et al. (2000) generated mice deficient in Ryk (OMIM Ref. No. 600524) and found that they had a distinctive craniofacial appearance, shortened limbs, and postnatal mortality due to feeding and respiratory complications associated with a complete cleft of the secondary palate. Consistent with cleft palate phenocopy in Ephb2 (OMIM Ref. No. 600997)/Ephb3-deficient mice and the role of a Drosophila Ryk ortholog, 'Derailed,' in the transduction of repulsive axon pathfinding cues, biochemical data implicated Ryk in signaling mediated by Eph receptors and cell junction-associated Af6 (OMIM Ref. No. 159559). Halford et al. (2000) concluded that their findings highlighted the importance of signal crosstalk between members of different RTK subfamilies.

[21221] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21222] Bohme, B.; Holtrich, U.; Wolf, G.; Luzius, H.; Grzeschik, K.-H.; Strebhardt, K.; Rubsamen-Waigmann, H. : PCR me-

diated detection of a new human receptor-tyrosine-kinase, HEK 2. Oncogene 8: 2857-2862, 1993. ; and

[21223] Halford, M. M.; Armes, J.; Buchert, M.; Meskenaite, V.; Grail, D.; Hibbs, M. L.; Wilks, A. F.; Farlie, P. G.; Newgreen, D. F.; Hovens, C. M.; Stacker, S. A. : Ryk-deficient mice exhibit.

[21224] Further studies establishing the function and utilities of EPHB3 are found in John Hopkins OMIM database record ID 601839, and in cited publications numbered 887 and 8879 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0222 (Accession NM\_014643) is another VGAM455 host target gene. KIAA0222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0222 BINDING SITE, designated SEQ ID:16045, to the nucleotide sequence of VGAM455 RNA, herein designated VGAM RNA, also designated SEQ ID:3166.

[21225] Another function of VGAM455 is therefore inhibition of KIAA0222 (Accession NM\_014643). Accordingly, utilities

of VGAM455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0222. MGC10818 (Accession NM\_030568) is another VGAM455 host target gene. MGC10818 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10818 BINDING SITE, designated SEQ ID:24943, to the nucleotide sequence of VGAM455 RNA, herein designated VGAM RNA, also designated SEQ ID:3166.

[21226] Another function of VGAM455 is therefore inhibition of MGC10818 (Accession NM\_030568). Accordingly, utilities of VGAM455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 456 (VGAM456) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21227] VGAM456 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM456 was detected is described hereinabove with reference to Figs. 1–8.

[21228] VGAM456 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21229] VGAM456 gene encodes a VGAM456 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM456 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM456 precursor RNA is designated SEQ ID:442, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:442 is located at position 31089 relative to the genome of Variola Virus.

[21230] VGAM456 precursor RNA folds onto itself, forming VGAM456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21231] An enzyme complex designated DICER COMPLEX, `dices` the VGAM456 folded precursor RNA into VGAM456 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM456 RNA is designated SEQ ID:3167, and is provided hereinbelow with reference to the sequence listing part.

[21232] VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM456 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21233] VGAM456 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM456 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM456 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21234] The complementary binding of VGAM456 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM456 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM456 host target RNA into VGAM456 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21235] It is appreciated that VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM456 host target genes. The mRNA of each one of this plurality of VGAM456 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM456 RNA, herein designated VGAM RNA, and which when bound by VGAM456 RNA causes inhibition of translation of respective one or more VGAM456 host target proteins.

[21236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM456 gene, herein designated VGAM GENE, on one or more VGAM456 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21237] It is yet further appreciated that a function of VGAM456 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM456 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM456 correlate with, and may be deduced from, the identity of the host target genes which VGAM456 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21238] Nucleotide sequences of the VGAM456 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM456 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM456 are further described hereinbelow with reference to Table 1.

[21239] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM456 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM456 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21240] As mentioned hereinabove with reference to Fig. 1, a function of VGAM456 gene, herein designated VGAM is inhibition of expression of VGAM456 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM456 correlate with, and may be deduced from, the identity of the target genes which VGAM456 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21241] Regulator of G-protein Signalling 17 (RGS17, Accession NM\_012419) is a VGAM456 host target gene. RGS17 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by RGS17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS17 BINDING SITE, designated SEQ ID:14791, to the nucleotide sequence of VGAM456 RNA, herein designated VGAM RNA, also designated SEQ ID:3167.

[21242] A function of VGAM456 is therefore inhibition of Regulator of G-protein Signalling 17 (RGS17, Accession NM\_012419). Accordingly, utilities of VGAM456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS17. Zinc Finger Protein 387 (ZNF387, Accession NM\_014682) is another VGAM456 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16172, to the nucleotide sequence of VGAM456 RNA, herein designated VGAM RNA, also designated SEQ ID:3167.

[21243] Another function of VGAM456 is therefore inhibition of

Zinc Finger Protein 387 (ZNF387, Accession NM\_014682). Accordingly, utilities of VGAM456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 457 (VGAM457) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21244] VGAM457 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM457 was detected is described hereinabove with reference to Figs. 1–8.

[21245] VGAM457 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21246] VGAM457 gene encodes a VGAM457 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM457 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM457 precursor RNA is designated SEQ ID:443, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:443 is located at position 31432 relative to the genome of Vari-ola Virus.

[21247] VGAM457 precursor RNA folds onto itself, forming VGAM457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21248] An enzyme complex designated DICER COMPLEX, `dices` the VGAM457 folded precursor RNA into VGAM457 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM457 RNA is designated SEQ ID:3168, and

is provided hereinbelow with reference to the sequence listing part.

[21249] VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM457 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21250] VGAM457 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM457 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM457 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21251] The complementary binding of VGAM457 RNA, herein designated VGAM RNA, to host target binding sites on VGAM457 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM457 host target RNA into VGAM457 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21252] It is appreciated that VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM457 host target genes. The mRNA of each one of this plurality of VGAM457 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM457 RNA, herein designated VGAM RNA, and which when bound by VGAM457 RNA causes inhibition of translation of respective one or more VGAM457 host target proteins.

[21253] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM457 gene, herein designated VGAM GENE, on one or more VGAM457 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21254] It is yet further appreciated that a function of VGAM457 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM457 correlate with, and may be deduced from, the identity of the host target genes which VGAM457 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21255] Nucleotide sequences of the VGAM457 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM457 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM457 are further described hereinbelow with reference to Table 1.

[21256] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM457 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM457 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21257] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM457 gene, herein designated VGAM is inhibition of expression of VGAM457 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM457 correlate with, and may be deduced from, the identity of the target genes which VGAM457 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21258] Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NM\_001232) is a VGAM457 host target gene. CASQ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASQ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASQ2 BINDING SITE, designated SEQ ID:6903, to the nucleotide sequence of VGAM457 RNA, herein designated VGAM RNA, also designated SEQ ID:3168.

[21259] A function of VGAM457 is therefore inhibition of Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NM\_001232). Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASQ2. KIAA1715 (Accession XM\_042834) is another VGAM457 host target

gene. KIAA1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:33792, to the nucleotide sequence of VGAM457 RNA, herein designated VGAM RNA, also designated SEQ ID:3168.

[21260] Another function of VGAM457 is therefore inhibition of KIAA1715 (Accession XM\_042834). Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715. PRO0097 (Accession NM\_014114) is another VGAM457 host target gene. PRO0097 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0097 BINDING SITE, designated SEQ ID:15365, to the nucleotide sequence of VGAM457 RNA, herein designated VGAM RNA, also designated SEQ ID:3168.

[21261] Another function of VGAM457 is therefore inhibition of PRO0097 (Accession NM\_014114). Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0097. LOC143915 (Accession XM\_096502) is another VGAM457 host target gene. LOC143915 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143915 BINDING SITE, designated SEQ ID:40380, to the nucleotide sequence of VGAM457 RNA, herein designated VGAM RNA, also designated SEQ ID:3168.

[21262] Another function of VGAM457 is therefore inhibition of LOC143915 (Accession XM\_096502). Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143915. LOC170063 (Accession XM\_104820) is another VGAM457 host target gene. LOC170063 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170063, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170063 BINDING SITE, designated SEQ ID:42188, to the nucleotide sequence of VGAM457 RNA, herein designated VGAM RNA, also designated SEQ ID:3168.

[21263] Another function of VGAM457 is therefore inhibition of LOC170063 (Accession XM\_104820). Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170063. LOC90268 (Accession XM\_030424) is another VGAM457 host target gene. LOC90268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90268 BINDING SITE, designated SEQ ID:31041, to the nucleotide sequence of VGAM457 RNA, herein designated VGAM RNA, also designated SEQ ID:3168.

[21264] Another function of VGAM457 is therefore inhibition of LOC90268 (Accession XM\_030424). Accordingly, utilities of VGAM457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 458 (VGAM458) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21265] VGAM458 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM458 was detected is described hereinabove with reference to Figs. 1–8.

[21266] VGAM458 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21267] VGAM458 gene encodes a VGAM458 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM458 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM458 precursor RNA is designated SEQ ID:444, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:444 is located at position 72676 relative to the genome of Camelpox Virus.

[21268] VGAM458 precursor RNA folds onto itself, forming VGAM458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21269] An enzyme complex designated DICER COMPLEX, `dices` the VGAM458 folded precursor RNA into VGAM458 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM458 RNA is designated SEQ ID:3169, and is provided hereinbelow with reference to the sequence listing part.

[21270] VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM458 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21271] VGAM458 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM458 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM458 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[21272] The complementary binding of VGAM458 RNA, herein designated VGAM RNA, to host target binding sites on VGAM458 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM458 host target RNA into VGAM458 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21273] It is appreciated that VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM458 host target genes. The mRNA of each one of this plurality of VGAM458 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM458 RNA, herein designated VGAM RNA, and which when bound by VGAM458 RNA causes in-

hibition of translation of respective one or more VGAM458 host target proteins.

[21274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM458 gene, herein designated VGAM GENE, on one or more VGAM458 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21275] It is yet further appreciated that a function of VGAM458 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM458 include diagnosis, prevention and

treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM458 correlate with, and may be deduced from, the identity of the host target genes which VGAM458 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [21276] Nucleotide sequences of the VGAM458 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM458 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM458 are further described hereinbelow with reference to Table 1.
- [21277] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM458 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM458 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21278] As mentioned hereinabove with reference to Fig. 1, a function of VGAM458 gene, herein designated VGAM is inhibition of expression of VGAM458 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM458 correlate with, and may be deduced from, the identity of the target genes which VGAM458 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21279] Hydroxysteroid (17-beta) Dehydrogenase 1 (HSD17B1, Accession NM\_000413) is a VGAM458 host target gene. HSD17B1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSD17B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSD17B1 BINDING SITE, designated SEQ ID:5996, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21280] A function of VGAM458 is therefore inhibition of Hydroxysteroid (17-beta) Dehydrogenase 1 (HSD17B1, Accession NM\_000413). Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSD17B1. Integral Membrane Protein 2B (ITM2B, Accession NM\_021999) is another VGAM458 host target gene. ITM2B BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITM2B BINDING SITE, designated SEQ ID:22541, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21281] Another function of VGAM458 is therefore inhibition of Integral Membrane Protein 2B (ITM2B, Accession NM\_021999), a gene which is a member of the type II integral membrane protein family. Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITM2B. The function of ITM2B has been established by previous studies. Using isolated amyloid fibrils from a patient with familial British dementia (FBD; 176500), Vidal et al. (1999) identified a unique 4-kD protein subunit, which they called ABRI, that is encoded by a novel gene, BRI. The BRI cDNA encodes a predicted protein of 266 amino acids. The first ATG is located 150 basepairs downstream of an in-frame TAG stop codon and has a classic Kozak consensus sequence. Hydropathy analysis indicated the presence

of a putative single transmembrane-spanning domain between amino acids 52 and 74, indicating that this highly insoluble molecule is a type II integral transmembrane protein with the C-terminal part being extracellular. A potential N-glycosylation site was identified at asparagine-170. Homology searches done with other species including chicken, rat, mouse, rabbit, and pig showed highly homologous ORFs, with human and murine identity being 96%. Northern blot analysis revealed 2.0- and 1.6-kb mRNA transcripts, which were expressed in most regions of the brain as well as in several peripheral tissues Ghiso et al. (2001) reported that carriers of the ter267-to-arg mutation (603904.0001) have a soluble form of the amyloid peptide (sABRI) in the circulation with an estimated concentration in the range of 20 ng/ml, several-fold higher than that of soluble amyloid-beta (OMIM Ref. No. 104760). In addition, ABRI species identical to those identified in the brain were also found as fibrillar components of amyloid deposits predominantly in the blood vessels of several peripheral tissues, including pancreas and myocardium. Ghiso et al. (2001) hypothesized that the high concentration of the soluble de novo-created amyloidal peptide and/or the insufficient tissue clearance are

the main causative factors for the formation of amyloid deposits outside the brain. Thus, familial British dementia constitutes the first documented cerebral amyloidosis associated with neurodegeneration and dementia in which the amyloid deposition is also systemic

[21282] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21283] Ghiso, J. A.; Holton, J.; Miravalle, L.; Calero, M.; Lashley, T.; Vidal, R.; Houlden, H.; Wood, N.; Neubert, T. A.; Rostagno, A.; Plant, G.; Revesz, T.; Frangione, B. : Systemic amyloid deposits in familial British dementia. J. Biol. Chem. 276: 43909–43914, 2001. ; and

[21284] Vidal, R.; Revesz, T.; Rostagno, A.; Kim, E.; Holton, J. L.; Bek, T.; Bojsen-Moller, M.; Braendgaard, H.; Plant, G.; Ghiso, J.; Frangione, B. : A decamer duplication in the 3-prime regi.

[21285] Further studies establishing the function and utilities of ITM2B are found in John Hopkins OMIM database record ID 603904, and in cited publications numbered 8197–8198, 1235 and 12685 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Polymeric Immunoglobulin Receptor (PIGR,

Accession XM\_052013) is another VGAM458 host target gene. PIGR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:35935, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21286] Another function of VGAM458 is therefore inhibition of Polymeric Immunoglobulin Receptor (PIGR, Accession XM\_052013). Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGR. Rhesus Blood Group, D Antigen (RHD, Accession NM\_016124) is another VGAM458 host target gene. RHD BINDING SITE1 and RHD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RHD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE1 and RHD BINDING SITE2, designated SEQ ID:18214 and SEQ ID:18334 respectively, to the nu-

cleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21287] Another function of VGAM458 is therefore inhibition of Rhesus Blood Group, D Antigen (RHD, Accession NM\_016124), a gene which Major antigen of the RH system. Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD. The function of RHD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.DKFZP434C1715 (Accession XM\_098421) is another VGAM458 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41675, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21288] Another function of VGAM458 is therefore inhibition of DKFZP434C1715 (Accession XM\_098421). Accordingly,

utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C1715. GFR (Accession NM\_012294) is another VGAM458 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14639, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21289] Another function of VGAM458 is therefore inhibition of GFR (Accession NM\_012294). Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. Solute Carrier Family 7, (cationic amino acid transporter,  $\gamma^+$  system) Member 11 (SLC7A11, Accession NM\_014331) is another VGAM458 host target gene. SLC7A11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of SLC7A11 BINDING SITE, designated SEQ ID:15645, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21290] Another function of VGAM458 is therefore inhibition of Solute Carrier Family 7, (cationic amino acid transporter,  $\gamma^+$  system) Member 11 (SLC7A11, Accession NM\_014331). Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A11. Ubiquitin Specific Protease 24 (USP24, Accession XM\_165973) is another VGAM458 host target gene. USP24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP24 BINDING SITE, designated SEQ ID:43819, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21291] Another function of VGAM458 is therefore inhibition of Ubiquitin Specific Protease 24 (USP24, Accession XM\_165973). Accordingly, utilities of VGAM458 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with USP24. LOC205251 (Accession XM\_119554) is another VGAM458 host target gene. LOC205251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205251 BINDING SITE, designated SEQ ID:43590, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21292] Another function of VGAM458 is therefore inhibition of LOC205251 (Accession XM\_119554). Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205251. LOC254251 (Accession XM\_171088) is another VGAM458 host target gene. LOC254251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254251 BINDING SITE, designated SEQ ID:45899, to the nucleotide sequence of VGAM458 RNA, herein designated VGAM RNA, also designated SEQ ID:3169.

[21293] Another function of VGAM458 is therefore inhibition of LOC254251 (Accession XM\_171088). Accordingly, utilities of VGAM458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 459 (VGAM459) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21294] VGAM459 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM459 was detected is described hereinabove with reference to Figs. 1–8.

[21295] VGAM459 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM459 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21296] VGAM459 gene encodes a VGAM459 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM459 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM459 precursor RNA is designated SEQ ID:445, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:445 is located at position 78528 relative to the genome of Ectromelia Virus.

[21297] VGAM459 precursor RNA folds onto itself, forming VGAM459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21298] An enzyme complex designated DICER COMPLEX, `dices` the VGAM459 folded precursor RNA into VGAM459 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM459 RNA is designated SEQ ID:3170, and is provided hereinbelow with reference to the sequence listing part.

[21299] VGAM459 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM459 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21300] VGAM459 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM459 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM459 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21301] The complementary binding of VGAM459 RNA, herein designated VGAM RNA, to host target binding sites on VGAM459 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM459 host target RNA into VGAM459 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21302] It is appreciated that VGAM459 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM459 host target genes. The mRNA of each one of this plurality of VGAM459 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM459 RNA, herein designated VGAM RNA, and which when bound by VGAM459 RNA causes inhibition of translation of respective one or more VGAM459 host target proteins.

[21303] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM459 gene, herein designated VGAM GENE, on one or more VGAM459 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[21304] It is yet further appreciated that a function of VGAM459 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM459 correlate with, and may be deduced from, the identity of the host target genes which VGAM459 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21305] Nucleotide sequences of the VGAM459 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM459 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM459 are further described hereinbelow with reference to Table 1.

[21306] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM459 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM459 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21307] As mentioned hereinabove with reference to Fig. 1, a function of VGAM459 gene, herein designated VGAM is inhibition of expression of VGAM459 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM459 correlate with, and may be deduced from, the identity of the target genes which VGAM459 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21308] Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246) is a VGAM459 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15519, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21309] A function of VGAM459 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, *Drosophila*) (CELSR1, Accession NM\_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 has been established by previous studies. By screening a mouse embryonic cDNA library, Hadjantonakis et al. (1997, 1998) obtained a cDNA encoding a 3,034-amino acid 7-pass transmembrane G protein-coupled receptor, which they termed cadherin EGF LAG seven-pass G-type receptor-1 (OMIM Ref. No. Celsr1). Celsr1 contains motifs that are recognized as mediators of protein-protein interactions. In its extracellular region it has a block of contiguous cadherin repeats in the N terminus and then a region with 7 epidermal growth factor (EGF; 131530)-like repeats interrupted by 2 laminin A (OMIM Ref. No. 150320) G-type (LAG) repeats. By in situ hybridization and RT-PCR analysis, Hadjantonakis et al. (1997) detected significant levels of Celsr1 in neural tube, brain, lung epithelium, and nascent eyelid in day 11.5 mouse embryos. In adult mice, expression was detected in spinal cord, eye,

and brain, chiefly in ependymal cells lining the lateral, third, and fourth ventricles. The structure, putative G-linked signaling properties, and restricted expression of the Celsr1 protein suggest that it is a receptor involved in contact-mediated communication.

[21310] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21311] Hadjantonakis, A.-K.; Formstone, C. J.; Little, P. F. R. : mCelsr1 is an evolutionarily conserved seven-pass trans-membrane receptor and is expressed during mouse embryonic development. Mech. Dev. 78: 91-95, 1998. ; and

[21312] Hadjantonakis, A.-K.; Sheward, W. J.; Harmar, A. J.; de Galan, L.; Hoovers, J. M. N.; Little, P. F. R. : Celsr1, a neural-specific gene encoding an unusual seven-pass trans-membrane rece.

[21313] Further studies establishing the function and utilities of CELSR1 are found in John Hopkins OMIM database record ID 604523, and in cited publications numbered 6933-693 and 7438 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurobeachin (NBEA, Accession XM\_170732) is another VGAM459 host target gene. NBEA BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NBEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBEA BINDING SITE, designated SEQ ID:45490, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21314] Another function of VGAM459 is therefore inhibition of Neurobeachin (NBEA, Accession XM\_170732), a gene which may mediate protein-protein interactions. Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBEA. The function of NBEA has been established by previous studies. The targeting of protein kinase A (PKA) actions to specific subcellular sites is mediated in part by A-kinase anchor proteins (AKAPs; OMIM Ref. No. 602449), a large and diverse group of proteins that includes neurobeachin. AKAPs reside at distinct subcellular locations and possess high-affinity binding sites for the type II regulatory subunit isoforms of PKA. By immunoscreening a chicken brain cDNA expression library with antibody to synaptic plasma membranes, followed by

probing of a mouse cDNA library, Wang et al. (2000) identified a predominantly brain-expressed cDNA encoding Nbea. Sequence analysis predicted that the 2,936-amino acid cytosolic protein contains a series of C-terminal WD40 repeats preceded by an approximately 280-amino acid BEACH (for beige and Chediak-Higashi) domain, originally identified by Nagle et al. (1996) in LYST (OMIM Ref. No. 606897), the protein mutated in the Chediak-Higashi syndrome. BEACH is a conserved sequence, larger than a protein-protein interaction site, that is also found in human FAN (NSMAF; 603043) and the partial sequence known as BGL or CDC4L. Binding analysis showed that region B of Nbea binds with high affinity and specificity to the type II regulatory subunits, preferentially RII- $\alpha$ , of PKA. Helical wheel analysis revealed the potential for an amphiphilic  $\alpha$  helix and the formation of a core binding site. Northern blot analysis of chicken tissue and Western blot analysis of mouse tissue indicated that Nbea expression is selective for brain. Immunocytochemical analysis demonstrated association with pleomorphic tubulovesicular endomembranes near the trans sides of Golgi stacks and in a subpopulation of synapses. Immunofluorescence microscopy revealed that Nbea associ-

ation with Golgi–near membranes is stimulated by GTP–gamma–S and dispersed by brefeldin A.

[21315] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21316] Gilbert, D. J.; Engel, H.; Wang, X.; Grzeschik, K.–H.; Copeland, N. G.; Jenkins, N. A.; Kilimann, M. W. : The neurobeachin gene (Nbea) identifies a new region of homology between mouse central chromosome 3 and human chromosome 13q13. *Mamm. Genome* 10: 1030–1031, 1999. ; and

[21317] Nagle, D. L.; Karim, M. A.; Woolf, E. A.; Holmgren, L.; Bork, P.; Misumi, D. J.; McGrail, S. H.; Dussault, B. J., Jr.; Perou, C. M.; Boissy, R. E.; Duyk, G. M.; Spritz, R. A.; Moore, K.

[21318] Further studies establishing the function and utilities of NBEA are found in John Hopkins OMIM database record ID 604889, and in cited publications numbered 6950–6952 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sodium Channel, Voltage–gated, Type III, Alpha Polypeptide (SCN3A, Accession NM\_006922) is another VGAM459 host target gene. SCN3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SCN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN3A BINDING SITE, designated SEQ ID:13797, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21319] Another function of VGAM459 is therefore inhibition of Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM\_006922), a gene which may be important for maintaining neural membrane excitability. Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN3A. The function of SCN3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM124. Ubiquitin-like 3 (UBL3, Accession NM\_007106) is another VGAM459 host target gene. UBL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of UBL3 BINDING SITE, designated SEQ ID:13963, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21320] Another function of VGAM459 is therefore inhibition of Ubiquitin-like 3 (UBL3, Accession NM\_007106), a gene which appears to have a diverse range of cellular functions. Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBL3. The function of UBL3 has been established by previous studies. Ubiquitin (OMIM Ref. No. 191320) targets proteins for degradation by the 26S proteasome (see OMIM Ref. No. 603146). In contrast, ubiquitin-like (UBL) proteins (e.g., UBL1; 601912) may not be directly involved in protein degradation, but appear to have a diverse range of cellular functions (reviewed by Hodges et al., 1998). Chadwick et al. (1999) identified the *Drosophila* UBL3 gene. By searching an EST database using a *Drosophila* UBL3 cDNA as the query, they identified a human UBL3 EST. Using the EST, they isolated human keratinocyte stem cell cDNAs representing the complete UBL3 coding sequence. The deduced 117-amino acid human UBL3 protein contains 2 potential N-glycosylation

sites, a potential protein kinase C phosphorylation site, and a potential C-terminal prenylation site. It is relatively hydrophilic with no predicted transmembrane domains. Human UBL3 shares 69% amino acid sequence identity with 1 form of *Drosophila* UBL3 and 99% identity with mouse Ubl3, a cDNA of which Chadwick et al. (1999) also isolated. Northern blot analysis of human tissues detected 3.5- and 4.5-kb UBL3 transcripts in all tissues tested, namely spleen, thymus, peripheral blood leukocytes, testis, ovary, placenta, prostate, liver, pancreas, small intestine, colon, kidney, heart, lung, brain, and skeletal muscle. Additional transcripts of 2.0 and 3.0 kb were found in testis. Chadwick et al. (1999) identified 3 polyadenylation signals that result in alternatively polyadenylated UBL3 transcripts. By somatic cell hybrid mapping, Chadwick et al. (1999) mapped the human UBL3 gene to chromosome 13. They localized the UBL3 gene to 13q12-q13 using radiation hybrid mapping. Using FISH, Chadwick et al. (1999) mapped the mouse Ubl3 gene to the telomeric end of chromosome 5 in band G2-3, a region showing homology of synteny with human 13q.

[21321] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [21322] Chadwick, B. P.; Kidd, T.; Sgouros, J.; Ish-Horowicz, D.; Frischauf, A.-M. : Cloning, mapping and expression of UBL3, a novel ubiquitin-like gene. *Gene* 233: 189-195, 1999. ; and
- [21323] Hodges, M.; Tissot, C.; Freemont, P. S. : : Protein regulation: tag wrestling with relatives of ubiquitin. *Curr. Biol.* 8: R749-R752, 1998.
- [21324] Further studies establishing the function and utilities of UBL3 are found in John Hopkins OMIM database record ID 604711, and in cited publications numbered 4933-4934 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wilms Tumor 1 (WT1, Accession NM\_024424) is another VGAM459 host target gene. WT1 BINDING SITE1 through WT1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WT1 BINDING SITE1 through WT1 BINDING SITE4, designated SEQ ID:23668, SEQ ID:23672, SEQ ID:23676 and SEQ ID:5952 respectively, to the nucleotide sequence of VGAM459

RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21325] Another function of VGAM459 is therefore inhibition of Wilms Tumor 1 (WT1, Accession NM\_024424). Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WT1. C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911) is another VGAM459 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE, designated SEQ ID:25663, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21326] Another function of VGAM459 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911). Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7. HELO1 (Accession NM\_021814) is another

VGAM459 host target gene. HELO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HELO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HELO1 BINDING SITE, designated SEQ ID:22385, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21327] Another function of VGAM459 is therefore inhibition of HELO1 (Accession NM\_021814). Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HELO1. KIAA1203 (Accession XM\_049683) is another VGAM459 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35466, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21328] Another function of VGAM459 is therefore inhibition of KIAA1203 (Accession XM\_049683). Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. MGC14161 (Accession NM\_032892) is another VGAM459 host target gene. MGC14161 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14161 BINDING SITE, designated SEQ ID:26715, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21329] Another function of VGAM459 is therefore inhibition of MGC14161 (Accession NM\_032892). Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14161. PANK (Accession NM\_138316) is another VGAM459 host target gene. PANK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PANK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PANK BINDING SITE, designated SEQ ID:28717, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21330] Another function of VGAM459 is therefore inhibition of PANK (Accession NM\_138316). Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PANK. LOC133686 (Accession XM\_059667) is another VGAM459 host target gene. LOC133686 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133686 BINDING SITE, designated SEQ ID:37058, to the nucleotide sequence of VGAM459 RNA, herein designated VGAM RNA, also designated SEQ ID:3170.

[21331] Another function of VGAM459 is therefore inhibition of LOC133686 (Accession XM\_059667). Accordingly, utilities of VGAM459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC133686. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 460 (VGAM460) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21332] VGAM460 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM460 was detected is described hereinabove with reference to Figs. 1–8.

[21333] VGAM460 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM460 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21334] VGAM460 gene encodes a VGAM460 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM460 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM460 precursor RNA is designated SEQ ID:446, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:446 is

located at position 69643 relative to the genome of Vari-  
ola Virus.

[21335] VGAM460 precursor RNA folds onto itself, forming VGAM460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21336] An enzyme complex designated DICER COMPLEX, `dices` the VGAM460 folded precursor RNA into VGAM460 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM460 RNA is designated SEQ ID:3171, and is provided hereinbelow with reference to the sequence listing part.

[21337] VGAM460 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM460 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[21338] VGAM460 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM460 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM460 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM460 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[21339] The complementary binding of VGAM460 RNA, herein designated VGAM RNA, to host target binding sites on VGAM460 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM460 host target RNA into VGAM460 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21340] It is appreciated that VGAM460 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM460 host target genes. The mRNA of each one of this plurality of VGAM460 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM460 RNA, herein designated VGAM RNA, and which when bound by VGAM460 RNA causes inhibition of translation of respective one or more VGAM460

host target proteins.

[21341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM460 gene, herein designated VGAM GENE, on one or more VGAM460 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21342] It is yet further appreciated that a function of VGAM460 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific func-

tions, and accordingly utilities, of VGAM460 correlate with, and may be deduced from, the identity of the host target genes which VGAM460 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [21343] Nucleotide sequences of the VGAM460 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM460 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM460 are further described hereinbelow with reference to Table 1.
- [21344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM460 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM460 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21345] As mentioned hereinabove with reference to Fig. 1, a function of VGAM460 gene, herein designated VGAM is inhibition of expression of VGAM460 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM460 correlate with, and may be deduced from, the identity of the target genes which VGAM460 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21346] 2',3'-cyclic Nucleotide 3' Phosphodiesterase (CNP, Accession NM\_033133) is a VGAM460 host target gene. CNP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNP BINDING SITE, designated SEQ ID:26976, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21347] A function of VGAM460 is therefore inhibition of 2',3'-cyclic Nucleotide 3' Phosphodiesterase (CNP, Accession NM\_033133), a gene which can link tubulin to membranes and may regulate cytoplasmic microtubule distribution. Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNP. The function of CNP and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM443. Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437) is another VGAM460 host target gene. NCOA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA4 BINDING SITE, designated SEQ ID:11922, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21348] Another function of VGAM460 is therefore inhibition of Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437), a gene which Binds and activates androgen receptor (AR) in ligand-dependent manner. Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA4. The function of NCOA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM420. Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM\_006521) is another VGAM460 host target gene. TFE3 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFE3 BINDING SITE, designated SEQ ID:13274, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21349] Another function of VGAM460 is therefore inhibition of Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM\_006521), a gene which is a positive-acting transcription factor that binds to the immunoglobulin enhancer *mu*3 motif. Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFE3. The function of TFE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM443. Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM\_004896) is another VGAM460 host target gene. VPS26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS26, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS26 BINDING SITE, designated SEQ ID:11329, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21350] Another function of VGAM460 is therefore inhibition of Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM\_004896), a gene which is a sorting protein– ensures the proper delivery of organelle–specific proteins. Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS26. The function of VPS26 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. Caspase Recruitment Domain Family, Member 6 (CARD6, Accession NM\_032587) is another VGAM460 host target gene. CARD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CARD6 BINDING SITE, designated SEQ ID:26322, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21351] Another function of VGAM460 is therefore inhibition of Caspase Recruitment Domain Family, Member 6 (CARD6, Accession NM\_032587). Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD6. DKFZp761K1423 (Accession NM\_018422) is another VGAM460 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20475, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21352] Another function of VGAM460 is therefore inhibition of DKFZp761K1423 (Accession NM\_018422). Accordingly, utilities of VGAM460 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp761K1423. KIAA0090 (Accession XM\_114045) is another VGAM460 host target gene. KIAA0090 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42655, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21353] Another function of VGAM460 is therefore inhibition of KIAA0090 (Accession XM\_114045). Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. KIAA0543 (Accession XM\_044213) is another VGAM460 host target gene. KIAA0543 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0543, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0543 BINDING SITE, designated SEQ ID:34180, to the

nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21354] Another function of VGAM460 is therefore inhibition of KIAA0543 (Accession XM\_044213). Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0543. Lymphocyte Antigen 75 (LY75, Accession NM\_002349) is another VGAM460 host target gene. LY75 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LY75, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LY75 BINDING SITE, designated SEQ ID:8152, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21355] Another function of VGAM460 is therefore inhibition of Lymphocyte Antigen 75 (LY75, Accession NM\_002349). Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY75. LOC146179 (Accession XM\_085354) is another VGAM460 host target gene. LOC146179 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC146179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146179 BINDING SITE, designated SEQ ID:38077, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21356] Another function of VGAM460 is therefore inhibition of LOC146179 (Accession XM\_085354). Accordingly, utilities of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146179. LOC221399 (Accession XM\_168134) is another VGAM460 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45053, to the nucleotide sequence of VGAM460 RNA, herein designated VGAM RNA, also designated SEQ ID:3171.

[21357] Another function of VGAM460 is therefore inhibition of LOC221399 (Accession XM\_168134). Accordingly, utilities

of VGAM460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 461 (VGAM461) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21358] VGAM461 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM461 was detected is described hereinabove with reference to Figs. 1–8.

[21359] VGAM461 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21360] VGAM461 gene encodes a VGAM461 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM461 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM461 precursor RNA is designated SEQ

ID:447, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:447 is located at position 119548 relative to the genome of Variola Virus.

[21361] VGAM461 precursor RNA folds onto itself, forming VGAM461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21362] An enzyme complex designated DICER COMPLEX, `dices` the VGAM461 folded precursor RNA into VGAM461 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM461 RNA is designated SEQ ID:3172, and is provided hereinbelow with reference to the sequence

listing part.

[21363] VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM461 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21364] VGAM461 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM461 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM461 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21365] The complementary binding of VGAM461 RNA, herein designated VGAM RNA, to host target binding sites on VGAM461 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM461 host target RNA into VGAM461 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21366] It is appreciated that VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM461 host target genes. The mRNA of each one of this plurality of VGAM461 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM461 RNA, herein designated VGAM

RNA, and which when bound by VGAM461 RNA causes inhibition of translation of respective one or more VGAM461 host target proteins.

[21367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM461 gene, herein designated VGAM GENE, on one or more VGAM461 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21368] It is yet further appreciated that a function of VGAM461 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM461 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM461 correlate with, and may be deduced from, the identity of the host target genes which VGAM461 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21369] Nucleotide sequences of the VGAM461 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM461 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM461 are further described hereinbelow with reference to Table 1.

[21370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM461 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM461 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21371] As mentioned hereinabove with reference to Fig. 1, a function of VGAM461 gene, herein designated VGAM is

inhibition of expression of VGAM461 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM461 correlate with, and may be deduced from, the identity of the target genes which VGAM461 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21372] FLJ14009 (Accession NM\_024760) is a VGAM461 host target gene. FLJ14009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14009 BINDING SITE, designated SEQ ID:24112, to the nucleotide sequence of VGAM461 RNA, herein designated VGAM RNA, also designated SEQ ID:3172.

[21373] A function of VGAM461 is therefore inhibition of FLJ14009 (Accession NM\_024760). Accordingly, utilities of VGAM461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14009. KIAA0332 (Accession XM\_031553) is another VGAM461 host target gene. KIAA0332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31416, to the nucleotide sequence of VGAM461 RNA, herein designated VGAM RNA, also designated SEQ ID:3172.

[21374] Another function of VGAM461 is therefore inhibition of KIAA0332 (Accession XM\_031553). Accordingly, utilities of VGAM461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. PRO1768 (Accession NM\_014099) is another VGAM461 host target gene. PRO1768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1768 BINDING SITE, designated SEQ ID:15323, to the nucleotide sequence of VGAM461 RNA, herein designated VGAM RNA, also designated SEQ ID:3172.

[21375] Another function of VGAM461 is therefore inhibition of PRO1768 (Accession NM\_014099). Accordingly, utilities of

VGAM461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1768. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 462 (VGAM462) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21376] VGAM462 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM462 was detected is described hereinabove with reference to Figs. 1–8.

[21377] VGAM462 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21378] VGAM462 gene encodes a VGAM462 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM462 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM462 precursor RNA is designated SEQ ID:448, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:448 is located at position 168878 relative to the genome of Vari-  
ola Virus.

[21379] VGAM462 precursor RNA folds onto itself, forming VGAM462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21380] An enzyme complex designated DICER COMPLEX, `dices` the VGAM462 folded precursor RNA into VGAM462 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM462 RNA is designated SEQ ID:3173, and is provided hereinbelow with reference to the sequence listing part.

[21381] VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM462 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21382] VGAM462 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM462 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM462 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21383] The complementary binding of VGAM462 RNA, herein designated VGAM RNA, to host target binding sites on VGAM462 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM462 host target RNA into VGAM462 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21384] It is appreciated that VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM462 host target genes. The mRNA of each one of this plurality of VGAM462 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM462 RNA, herein designated VGAM RNA, and which when bound by VGAM462 RNA causes in-

hibition of translation of respective one or more VGAM462 host target proteins.

[21385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM462 gene, herein designated VGAM GENE, on one or more VGAM462 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21386] It is yet further appreciated that a function of VGAM462 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM462 include diagnosis, prevention and

treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM462 correlate with, and may be deduced from, the identity of the host target genes which VGAM462 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [21387] Nucleotide sequences of the VGAM462 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM462 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM462 are further described hereinbelow with reference to Table 1.
- [21388] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM462 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM462 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21389] As mentioned hereinabove with reference to Fig. 1, a function of VGAM462 gene, herein designated VGAM is inhibition of expression of VGAM462 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM462 correlate with, and may be deduced from, the identity of the target genes which VGAM462 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21390] 5-hydroxytryptamine (serotonin) Receptor 6 (HTR6, Accession NM\_000871) is a VGAM462 host target gene. HTR6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR6 BINDING SITE, designated SEQ ID:6548, to the nucleotide sequence of VGAM462 RNA, herein designated VGAM RNA, also designated SEQ ID:3173.

[21391] A function of VGAM462 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 6 (HTR6, Accession NM\_000871), a gene which stimulates adenylate cyclase. Accordingly, utilities of VGAM462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR6. The function of HTR6 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM326. Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803) is another VGAM462 host target gene. CECR7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CECR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR7 BINDING SITE, designated SEQ ID:38876, to the nucleotide sequence of VGAM462 RNA, herein designated VGAM RNA, also designated SEQ ID:3173.

[21392] Another function of VGAM462 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803). Accordingly, utilities of VGAM462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR7. KIAA1203 (Accession XM\_049683) is another VGAM462 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35467, to the nucleotide sequence of VGAM462 RNA, herein designated VGAM RNA, also designated SEQ ID:3173.

[21393] Another function of VGAM462 is therefore inhibition of KIAA1203 (Accession XM\_049683). Accordingly, utilities of VGAM462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. KIAA1535 (Accession XM\_086565) is another VGAM462 host target gene. KIAA1535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1535 BINDING SITE, designated SEQ ID:38763, to the nucleotide sequence of VGAM462 RNA, herein designated VGAM RNA, also designated SEQ ID:3173.

[21394] Another function of VGAM462 is therefore inhibition of KIAA1535 (Accession XM\_086565). Accordingly, utilities of VGAM462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1535. KIAA1894 (Accession XM\_058025) is another

VGAM462 host target gene. KIAA1894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1894 BINDING SITE, designated SEQ ID:36560, to the nucleotide sequence of VGAM462 RNA, herein designated VGAM RNA, also designated SEQ ID:3173.

[21395] Another function of VGAM462 is therefore inhibition of KIAA1894 (Accession XM\_058025). Accordingly, utilities of VGAM462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1894. LOC151171 (Accession XM\_087116) is another VGAM462 host target gene. LOC151171 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151171 BINDING SITE, designated SEQ ID:39065, to the nucleotide sequence of VGAM462 RNA, herein designated VGAM RNA, also designated SEQ ID:3173.

[21396] Another function of VGAM462 is therefore inhibition of LOC151171 (Accession XM\_087116). Accordingly, utilities of VGAM462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151171. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 463 (VGAM463) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21397] VGAM463 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM463 was detected is described hereinabove with reference to Figs. 1–8.

[21398] VGAM463 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21399] VGAM463 gene encodes a VGAM463 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM463 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM463 precursor RNA is designated SEQ ID:449, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:449 is located at position 169316 relative to the genome of Variola Virus.

[21400] VGAM463 precursor RNA folds onto itself, forming VGAM463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21401] An enzyme complex designated DICER COMPLEX, `dices` the VGAM463 folded precursor RNA into VGAM463 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM463 RNA is designated SEQ ID:3174, and is provided hereinbelow with reference to the sequence listing part.

[21402] VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM463 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[21403] VGAM463 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM463 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM463 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[21404] The complementary binding of VGAM463 RNA, herein designated VGAM RNA, to host target binding sites on VGAM463 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM463 host target RNA into VGAM463 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21405] It is appreciated that VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM463 host target genes. The mRNA of each one of this plurality of VGAM463 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM463 RNA, herein designated VGAM RNA, and which when bound by VGAM463 RNA causes inhibition of translation of respective one or more VGAM463 host target proteins.

[21406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM463 gene, herein designated VGAM GENE, on one or more VGAM463 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21407] It is yet further appreciated that a function of VGAM463 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM463 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM463 correlate with, and may be deduced from, the identity of the host target genes which VGAM463 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21408] Nucleotide sequences of the VGAM463 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM463 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM463 are further described hereinbelow with reference to Table 1.

[21409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM463 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM463 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21410] As mentioned hereinabove with reference to Fig. 1, a function of VGAM463 gene, herein designated VGAM is inhibition of expression of VGAM463 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM463 correlate with, and may be deduced from, the identity of the target genes which VGAM463 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21411] Exonuclease 1 (EXO1, Accession NM\_003686) is a VGAM463 host target gene. EXO1 BINDING SITE1 through EXO1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EXO1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXO1 BINDING SITE1 through EXO1 BINDING SITE3, designated SEQ ID:9797, SEQ ID:12644 and SEQ ID:28183 respectively, to the nucleotide sequence of VGAM463 RNA, herein designated VGAM RNA, also designated SEQ ID:3174.

[21412] A function of VGAM463 is therefore inhibition of Exonuclease 1 (EXO1, Accession NM\_003686), a gene which excise and replace mismatched segments. Accordingly, utili-

ties of VGAM463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXO1. The function of EXO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM399. KIAA0237 (Accession NM\_014747) is another VGAM463 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16447, to the nucleotide sequence of VGAM463 RNA, herein designated VGAM RNA, also designated SEQ ID:3174.

[21413] Another function of VGAM463 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0863 (Accession XM\_170863) is another VGAM463 host target gene. KIAA0863 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0863, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0863 BINDING SITE, designated SEQ ID:45634, to the nucleotide sequence of VGAM463 RNA, herein designated VGAM RNA, also designated SEQ ID:3174.

[21414] Another function of VGAM463 is therefore inhibition of KIAA0863 (Accession XM\_170863). Accordingly, utilities of VGAM463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0863. KIAA1165 (Accession XM\_041162) is another VGAM463 host target gene. KIAA1165 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1165 BINDING SITE, designated SEQ ID:33474, to the nucleotide sequence of VGAM463 RNA, herein designated VGAM RNA, also designated SEQ ID:3174.

[21415] Another function of VGAM463 is therefore inhibition of KIAA1165 (Accession XM\_041162). Accordingly, utilities of VGAM463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1165. Purinergic Receptor P2X, Ligand-gated Ion Channel, 5 (P2RX5, Accession NM\_002561) is another VGAM463 host target gene. P2RX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX5 BINDING SITE, designated SEQ ID:8408, to the nucleotide sequence of VGAM463 RNA, herein designated VGAM RNA, also designated SEQ ID:3174.

[21416] Another function of VGAM463 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 5 (P2RX5, Accession NM\_002561). Accordingly, utilities of VGAM463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX5. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger

464 (VGAM464) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21417] VGAM464 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM464 was detected is described hereinabove with reference to Figs. 1–8.

[21418] VGAM464 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM464 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21419] VGAM464 gene encodes a VGAM464 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM464 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM464 precursor RNA is designated SEQ ID:450, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:450 is located at position 170440 relative to the genome of Variola Virus.

[21420] VGAM464 precursor RNA folds onto itself, forming VGAM464 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[21421] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM464 folded precursor RNA into VGAM464 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 44%) nucleotide se-  
quence of VGAM464 RNA is designated SEQ ID:3175, and  
is provided hereinbelow with reference to the sequence  
listing part.

[21422] VGAM464 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM464 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM464 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21423] VGAM464 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM464 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM464 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21424] The complementary binding of VGAM464 RNA, herein designated VGAM RNA, to host target binding sites on VGAM464 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM464 host target RNA into VGAM464 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21425] It is appreciated that VGAM464 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM464 host target genes. The mRNA of each one of this plurality of VGAM464 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM464 RNA, herein designated VGAM RNA, and which when bound by VGAM464 RNA causes inhibition of translation of respective one or more VGAM464 host target proteins.

[21426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM464 gene, herein designated VGAM GENE, on one or more VGAM464 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21427] It is yet further appreciated that a function of VGAM464 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM464 correlate with, and may be deduced from, the identity of the host target genes which VGAM464 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [21428] Nucleotide sequences of the VGAM464 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM464 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM464 are further described hereinbelow with reference to Table 1.
- [21429] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM464 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM464 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21430] As mentioned hereinabove with reference to Fig. 1, a function of VGAM464 gene, herein designated VGAM is inhibition of expression of VGAM464 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM464 correlate with, and may be deduced from, the identity of the target genes which VGAM464 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21431] Collagen, Type IV, Alpha 4 (COL4A4, Accession NM\_000092) is a VGAM464 host target gene. COL4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A4 BINDING SITE, designated SEQ ID:5555, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21432] A function of VGAM464 is therefore inhibition of Collagen, Type IV, Alpha 4 (COL4A4, Accession NM\_000092). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A4. Cytochrome P450, 51 (lanosterol 14-alpha-demethylase) (CYP51, Accession NM\_000786) is another VGAM464 host target gene. CYP51 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP51, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP51 BIND-

ING SITE, designated SEQ ID:6438, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21433] Another function of VGAM464 is therefore inhibition of Cytochrome P450, 51 (lanosterol 14- $\alpha$ -demethylase) (CYP51, Accession NM\_000786). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP51.

Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM\_003887) is another VGAM464 host target gene. DDEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDEF2 BINDING SITE, designated SEQ ID:9968, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21434] Another function of VGAM464 is therefore inhibition of Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM\_003887), a gene which interacts with members of the Arf and Src family. Accordingly, utili-

ties of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDEF2. The function of DDEF2 has been established by previous studies. By screening human brain cDNAs for those encoding large proteins, Ishikawa et al. (1997) identified a cDNA, which they called KIAA0400, encoding development- and differentiation-enhancing factor-2. They found that the deduced 1,006-amino acid DDEF2 protein contains a 60-amino acid zinc finger motif thought to be associated with GTPase activating protein (GAP) activity. Using PYK2 (OMIM Ref. No. 601212) as bait in a yeast 2-hybrid screen, Andreev et al. (1999) isolated DDEF2, a PYK2-binding protein which they designated PAP. DDEF2 is a multidomain protein composed of an N-terminal alpha-helical region with a coiled-coil motif, followed by a pleckstrin homology domain, an Arf-GAP domain, an ankyrin homology region, a proline-rich region, and a C-terminal SH3 domain. DDEF2 shares 95% sequence identity with the mouse homolog and 68% sequence identity with human DDEF1 (OMIM Ref. No. 605953). Andreev et al. (1999) identified 2 DDEF2 isoforms, designated PAP-alpha and PAP-beta, that differ by deletion of 45 amino acids from the proline-rich region and 172 amino acids

from the N terminus. Northern blot analysis detected expression of an approximately 5.7-kb transcript at high levels in brain, kidney, and heart, and at lower levels in placenta, lung, and pancreas. Immunofluorescence studies demonstrated that DDEF2 is localized in the Golgi apparatus and at the plasma membrane, where it is colocalized with PYK2. DDEF2 forms a stable complex with PYK2 and activation of PYK2 leads to tyrosine phosphorylation of DDEF2 in vivo. The interaction of DDEF2 and PYK2 appears to be mediated by binding of the SH3 domain of DDEF2 to the proline-rich region in the C terminus of PYK2. In addition, in vitro recombinant DDEF2 exhibits strong GAP activity towards the small GTPases ARF1 (OMIM Ref. No. 103180) and ARF5 (OMIM Ref. No. 103188) and weak activity towards ARF6 (OMIM Ref. No. 600464).

[21435] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21436] Andreev, J.; Simon, J.-P.; Sabatini, D. D.; Kam, J.; Plowman, G.; Randazzo, P. A.; Schlessinger, J. : Identification of a new Pyk2 target protein with Arf-GAP activity. *Molec. Cell. Biol.* 19: 2338-2350, 1999. ; and

[21437] Ishikawa, K.; Nagase, T.; Nakajima, D.; Seki, N.; Ohira, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human gene.

[21438] Further studies establishing the function and utilities of DDEF2 are found in John Hopkins OMIM database record ID 603817, and in cited publications numbered 4912 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin Interacting Protein 2 (HIP2, Accession NM\_005339) is another VGAM464 host target gene. HIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIP2 BINDING SITE, designated SEQ ID:11815, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21439] Another function of VGAM464 is therefore inhibition of Huntingtin Interacting Protein 2 (HIP2, Accession NM\_005339). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with HIP2. ISL1 Transcription Factor, LIM/homeodomain, (islet-1) (ISL1, Accession NM\_002202) is another VGAM464 host target gene. ISL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ISL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISL1 BINDING SITE, designated SEQ ID:7960, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21440] Another function of VGAM464 is therefore inhibition of ISL1 Transcription Factor, LIM/homeodomain, (islet-1) (ISL1, Accession NM\_002202), a gene which binds to one of the cis-acting domain of the insulin gene enhancer. Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL1. The function of ISL1 has been established by previous studies. Because insulin deficiency, either relative or absolute, is a cardinal feature of noninsulin-dependent diabetes mellitus (NIDDM; 125853), Tanizawa et al. (1994) investigated the possible involvement of mutations in genes that regulate insulin produc-

tion. Rat Isl1 was the first insulin enhancer-binding protein to be isolated; Tanizawa et al. (1994) used the rat gene to isolate a partial human ISL1 cDNA and subsequently to isolate genomic clones. A simple sequence repeat was found in the ISL1 gene. PCR amplification of this region of genomic DNA revealed 12 alleles in St. Louis African-Americans (heterozygosity = 0.87), 14 alleles in black Nigerians (heterozygosity = 0.89), 8 alleles in Japanese (heterozygosity = 0.69), and 8 alleles in Caucasians (heterozygosity = 0.81). Allelic frequencies in the gene did not differ between patients with NIDDM and nondiabetic control subjects in 2 black populations Shimomura et al. (2000) found a nonsense mutation (Q310X) in the ISL1 gene in a Japanese patient with type II diabetes and a strong family history. The mutation led to decreased activity of the islet-1 transcription factor and thus may have been pathogenic. However, as indicated by Fajans et al. (2001), additional genetic and clinical studies were required to determine whether mutations in ISL1 are the cause of another subtype of MODY

[21441] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21442] Shimomura, H.; Sanke, T.; Hanabusa, T.; Tsunoda, K.; Furuta, H.; Nanjo, K. : Nonsense mutation of islet-1 gene (Q310X) found in a type 2 diabetic patient with a strong family history. Diabetes 49: 1597-1600, 2000. ; and

[21443] Tanizawa, Y.; Riggs, A. C.; Dagogo-Jack, S.; Vaxillaire, M.; Froguel, P.; Liu, L.; Donis-Keller, H.; Permutt, M. A. : Isolation of the human LIM/homeodomain gene islet-1 and identificat.

[21444] Further studies establishing the function and utilities of ISL1 are found in John Hopkins OMIM database record ID 600366, and in cited publications numbered 12032 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. O-linked N-acetylglucosamine (GlcNAc) Transferase (UDP-N-acetylglucosamine:polypeptide-N-acetylglucosaminyl transferase) (OGT, Accession NM\_003605) is another VGAM464 host target gene. OGT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGT BINDING SITE, designated SEQ ID:9661, to the nucleotide sequence of

VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21445] Another function of VGAM464 is therefore inhibition of O-linked N-acetylglucosamine (GlcNAc) Transferase (UDP-N-acetylglucosamine:polypeptide-N-acetylglucosaminyl transferase) (OGT, Accession NM\_003605), a gene which has a role in the glycosylation of nuclear and cytoplasmic proteins. Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGT. The function of OGT has been established by previous studies. O-linked N-acetylglucosamine (O-GlcNAc) transferase (OGT) catalyzes the addition of a single N-acetylglucosamine in O-glycosidic linkage to serine or threonine residues. Since both phosphorylation and glycosylation compete for similar serine or threonine residues, the 2 processes may compete for sites, or they may alter the substrate specificity of nearby sites by steric or electrostatic effects (Lubas et al., 1997). Haltiwanger et al. (1992) purified rat liver OGT and determined that it has a molecular mass of 340 kD. They proposed that OGT exists as a heterotrimeric complex with 2 subunits of 110 kD and 1 of 78 kD. However, using rabbit OGT, Lubas et al. (1997) an-

alyzed the proteolytic fingerprint of both polypeptides and found that the 2 are related. They suggested that the 78 kD band is a proteolytic product of the 110 kD polypeptide or the product of an alternative translation start site. Kreppel et al. (1997) cloned rat cDNAs encoding the 110-kD subunit. Immunofluorescence of human cells expressing rat OGT indicated that OGT is present in both the nucleus and cytosol.

[21446] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21447] Kreppel, L. K.; Blomberg, M. A.; Hart, G. W. : Dynamic glycosylation of nuclear and cytosolic proteins: cloning and characterization of a unique O-GlcNAc transferase with multiple tetratricopeptide repeats. J. Biol. Chem. 272: 9308–9315, 1997. ; and

[21448] Lubas, W. A.; Frank, D. W.; Krause, M.; Hanover, J. A. : O-linked GlcNAc transferase is a conserved nucleocytoplasmic protein containing tetratricopeptide repeats. J. Biol. Chem. 272: 9.

[21449] Further studies establishing the function and utilities of OGT are found in John Hopkins OMIM database record ID 300255, and in cited publications numbered 9074–9078

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM\_000430) is another VGAM464 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ ID:6012, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21450] Another function of VGAM464 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM\_000430). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. Plastin 1 (I isoform) (PLS1, Accession NM\_002670) is another VGAM464 host target gene. PLS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLS1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLS1 BINDING SITE, designated SEQ ID:8541, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21451] Another function of VGAM464 is therefore inhibition of Plastin 1 (I isoform) (PLS1, Accession NM\_002670). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLS1. RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650) is another VGAM464 host target gene. RASA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASA1 BINDING SITE, designated SEQ ID:22904, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21452] Another function of VGAM464 is therefore inhibition of RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650), a gene which is involved

in the control of cellular proliferation and differentiation. Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASA1. The function of RASA1 has been established by previous studies. The RAS gene family encodes membrane-associated, guanine nucleotide-binding proteins (p21) that are involved in the control of cellular proliferation and differentiation. Similar to other guanine-binding proteins (such as the heterotrimeric G proteins), the RAS proteins cycle between an active guanosine-triphosphate (GTP) bound form and an inactive, guanosine-diphosphate (GDP) bound form. The weak intrinsic GTPase activity of RAS proteins is greatly enhanced by the action of GTPase-activating proteins (GAPs). GAP is an effector of RAS oncogene action. See also RASA2 (OMIM Ref. No. 601589). Trahey et al. (1988) purified guanosine triphosphatase-activating protein from placenta and obtained internal amino acid sequence of the protein from which they cloned 2 classes of cDNA. One class predicted a protein with molecular weight similar to purified GAP and corresponded to the human equivalent of bovine GAP cDNA. The other predicted a smaller protein with a different N-terminal sequence, presumably the result of differ-

ential splicing. Both types of cDNAs produced protein with GAP activity. Point mutations in RAS genes ('activating' or oncogenic mutants) decrease the intrinsic GTPase activity of RAS and are insensitive to stimulation by GAPs. This suggested to Friedman et al. (1993) that at least some of the transforming activity of mutant RAS is conferred by the RAS protein being constitutively activated in its GTP-bound state. Mutations in RAS that render it insensitive to GAP regulation result in tumor formation. Mutations in GAP that ablate its ability to downregulate RAS might result in a similar phenotype. To test this hypothesis, Friedman et al. (1993) analyzed 188 human tumor samples for mutations within the catalytic domain of the GAP gene and for mutations within its C-terminal SH2 region. Although no mutations could be demonstrated in the catalytic domain, 3 different nonsense mutations were observed in basal cell carcinomas. The region in which the mutations were clustered is A/T rich, raising the possibility that UV radiation is a contributing factor. The 3 mutations were found in the first 5 tumors examined. No abnormality was found in 16 other basal cell carcinomas. Thus, the apparent prevalence of GAP mutation was about 14% (3 of 21). The tumors analyzed included a great variety, including

cancers of thyroid, lung, breast, colon, and pancreas. No GAP mutation was found in any of these. Mitsudomi et al. (1994) could not demonstrate mutations in the catalytic domain of the GAP gene in human lung cancer cell lines.

[21453] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21454] Friedman, E.; Gejman, P. V.; Martin, G. A.; McCormick, F. : Nonsense mutations in the C-terminal SH2 region of the GTPase activating protein (GAP) gene in human tumours. Nature Genet. 5: 242–247, 1993. ; and

[21455] Trahey, M.; Wong, G.; Halenbeck, R.; Rubinfeld, B.; Martin, G. A.; Ladner, M.; Long, C. M.; Crosier, W. J.; Watt, K.; Kohts, K.; McCormick, F. : Molecular cloning of two types of GAP c.

[21456] Further studies establishing the function and utilities of RASA1 are found in John Hopkins OMIM database record ID 139150, and in cited publications numbered 4738–4743 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM\_004155) is another VGAM464 host target gene. SERPINB9 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10367, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21457] Another function of VGAM464 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM\_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Soc-2 Suppressor of Clear Homolog (C. elegans) (SHOC2, Accession NM\_007373) is another VGAM464 host target gene. SHOC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SHOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOC2 BINDING SITE, designated SEQ ID:14307, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21458] Another function of VGAM464 is therefore inhibition of Soc-2 Suppressor of Clear Homolog (*C. elegans*) (SHOC2, Accession NM\_007373), a gene which may be a regulator of the let-60 ras pathway. Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOC2. The function of SHOC2 has been established by previous studies. Activation of fibroblast growth factor (FGF) receptors elicits diverse cellular responses, including growth, mitogenesis, migration, and differentiation. Selfors et al. (1998) shed light on the intracellular signaling pathways that mediate these processes by studies in *Caenorhabditis elegans*. In this organism, they screened for genes that suppress the activity of an activated form of the EGL-15 FGF receptor consistent with the functioning of these genes downstream of EGL-15. Two of these genes were

soc1 and soc2, symbolized thus for 'suppressor of clear (Clr)' phenotype; the third was sem5. Selfors et al. (1998) showed that soc2 encodes a protein composed almost entirely of leucine-rich repeats, a domain implicated in protein-protein interactions. They identified a putative human homolog, SHOC2, which is 54% identical to soc2. They showed that SHOC2 mRNA was expressed in all tissues assayed and that the SHOC2 protein is localized to the cytoplasm. Within the leucine-rich repeats of both soc2 and SHOC2 are 2 YXNX motifs that are potential tyrosine-phosphorylated docking sites for the SEM5/GRB2 Src homology 2 domain. However, phosphorylation of these residues was not required for soc2 function in vivo, and SHOC2 was not observed to be tyrosine phosphorylated in response to FGF stimulation. Selfors et al. (1998) concluded that this genetic system identified a conserved gene implicated in mediating FGF receptor signaling in *C. elegans*. Sieburth et al. (1998) identified and characterized the sur8 gene in *C. elegans*, which positively regulates Ras-mediated signal transduction during vulval development. The authors found that reduction of sur8 function suppresses an activated Ras mutation and dramatically enhances phenotypes of mpk-1 MAP kinase and ksr-1

(OMIM Ref. No. 601132) mutations, whereas increase of sur8 dosage enhances an activated Ras mutation. Sur8 appears to act downstream of or in parallel to Ras but upstream of Raf. Sur8 encodes a conserved protein that is composed predominantly of leucine-rich repeats. The sur8 protein interacts directly with Ras but not with the Ras(P34G) mutant protein, suggesting that sur8 may mediate its effects through Ras binding. By use of EST primers and 5-prime RACE, Sieburth et al. (1998) cloned a structural and functional SUR8 homolog in humans that specifically binds K-Ras (OMIM Ref. No. 190070) and N-Ras (OMIM Ref. No. 164790) but not H-Ras (OMIM Ref. No. 190020) in vitro.

[21459] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21460] Selfors, L. M.; Schutzman, J. L.; Borland, C. Z.; Stern, M. J. : Soc-2 encodes a leucine-rich repeat protein implicated in fibroblast growth factor receptor signaling. Proc. Nat. Acad. Sci. 95: 6903-6908, 1998. ; and

[21461] Sieburth, D. S.; Sun, Q.; Han, M. : SUR-8, a conserved Ras-binding protein with leucine-rich repeats, positively regulates Ras-mediated signaling in C. elegans. Cell 94:

119–130, 1998.

[21462] Further studies establishing the function and utilities of SHOC2 are found in John Hopkins OMIM database record ID 602775, and in cited publications numbered 7648–7649 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10895 (Accession NM\_019084) is another VGAM464 host target gene. FLJ10895 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10895 BINDING SITE, designated SEQ ID:21160, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21463] Another function of VGAM464 is therefore inhibition of FLJ10895 (Accession NM\_019084). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10895. FLJ20038 (Accession NM\_017634) is another VGAM464 host target gene. FLJ20038 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by FLJ20038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20038 BINDING SITE, designated SEQ ID:19142, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21464] Another function of VGAM464 is therefore inhibition of FLJ20038 (Accession NM\_017634). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20038. FLJ23560 (Accession NM\_024685) is another VGAM464 host target gene. FLJ23560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23560 BINDING SITE, designated SEQ ID:23997, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21465] Another function of VGAM464 is therefore inhibition of FLJ23560 (Accession NM\_024685). Accordingly, utilities of

VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23560. GFR (Accession NM\_012294) is another VGAM464 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14641, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21466] Another function of VGAM464 is therefore inhibition of GFR (Accession NM\_012294). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. KIAA0258 (Accession NM\_014785) is another VGAM464 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE,

designated SEQ ID:16645, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21467] Another function of VGAM464 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0982 (Accession NM\_014023) is another VGAM464 host target gene. KIAA0982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0982 BINDING SITE, designated SEQ ID:15250, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21468] Another function of VGAM464 is therefore inhibition of KIAA0982 (Accession NM\_014023). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0982. KIAA1077 (Accession XM\_053496) is another VGAM464 host target gene. KIAA1077 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1077 BINDING SITE, designated SEQ ID:36097, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21469] Another function of VGAM464 is therefore inhibition of KIAA1077 (Accession XM\_053496). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1077. KIAA1962 (Accession XM\_088567) is another VGAM464 host target gene. KIAA1962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1962 BINDING SITE, designated SEQ ID:39834, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21470] Another function of VGAM464 is therefore inhibition of

KIAA1962 (Accession XM\_088567). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1962. MGC23980 (Accession NM\_145005) is another VGAM464 host target gene. MGC23980 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC23980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23980 BINDING SITE, designated SEQ ID:29605, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21471] Another function of VGAM464 is therefore inhibition of MGC23980 (Accession NM\_145005). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23980. RALGPS1A (Accession NM\_014636) is another VGAM464 host target gene. RALGPS1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16020, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21472] Another function of VGAM464 is therefore inhibition of RALGPS1A (Accession NM\_014636). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALGPS1A. TSLRP (Accession NM\_012472) is another VGAM464 host target gene. TSLRP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TSLRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSLRP BINDING SITE, designated SEQ ID:14853, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21473] Another function of VGAM464 is therefore inhibition of TSLRP (Accession NM\_012472). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSLRP. Ubiquitin-activating Enzyme E1C (UBA3 homolog, yeast)

(UBE1C, Accession NM\_003968) is another VGAM464 host target gene. UBE1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE1C BINDING SITE, designated SEQ ID:10108, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21474] Another function of VGAM464 is therefore inhibition of Ubiquitin-activating Enzyme E1C (UBA3 homolog, yeast) (UBE1C, Accession NM\_003968). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE1C. LOC144453 (Accession XM\_084869) is another VGAM464 host target gene. LOC144453 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144453 BINDING SITE, designated SEQ ID:37745, to the nucleotide se-

quence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21475] Another function of VGAM464 is therefore inhibition of LOC144453 (Accession XM\_084869). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144453. LOC144571 (Accession XM\_096630) is another VGAM464 host target gene. LOC144571 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144571 BINDING SITE, designated SEQ ID:40442, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21476] Another function of VGAM464 is therefore inhibition of LOC144571 (Accession XM\_096630). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144571. LOC145547 (Accession XM\_085167) is another VGAM464 host target gene. LOC145547 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC145547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145547 BINDING SITE, designated SEQ ID:37896, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21477] Another function of VGAM464 is therefore inhibition of LOC145547 (Accession XM\_085167). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145547. LOC145608 (Accession XM\_096818) is another VGAM464 host target gene. LOC145608 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145608 BINDING SITE, designated SEQ ID:40542, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21478] Another function of VGAM464 is therefore inhibition of LOC145608 (Accession XM\_096818). Accordingly, utilities

of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145608. LOC221692 (Accession XM\_166420) is another VGAM464 host target gene. LOC221692 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221692 BINDING SITE, designated SEQ ID:44296, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21479] Another function of VGAM464 is therefore inhibition of LOC221692 (Accession XM\_166420). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221692. LOC253443 (Accession XM\_171074) is another VGAM464 host target gene. LOC253443 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC253443 BINDING SITE, designated SEQ ID:45884, to the nucleotide sequence of VGAM464 RNA, herein designated VGAM RNA, also designated SEQ ID:3175.

[21480] Another function of VGAM464 is therefore inhibition of LOC253443 (Accession XM\_171074). Accordingly, utilities of VGAM464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253443. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 465 (VGAM465) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21481] VGAM465 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM465 was detected is described hereinabove with reference to Figs. 1–8.

[21482] VGAM465 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21483] VGAM465 gene encodes a VGAM465 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM465 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM465 precursor RNA is designated SEQ ID:451, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:451 is located at position 183993 relative to the genome of Variola Virus.

[21484] VGAM465 precursor RNA folds onto itself, forming VGAM465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21485] An enzyme complex designated DICER COMPLEX, `dices` the VGAM465 folded precursor RNA into VGAM465 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM465 RNA is designated SEQ ID:3176, and is provided hereinbelow with reference to the sequence listing part.

[21486] VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM465 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[21487] VGAM465 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM465 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM465 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21488] The complementary binding of VGAM465 RNA, herein designated VGAM RNA, to host target binding sites on VGAM465 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM465 host target RNA into VGAM465 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21489] It is appreciated that VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM465 host target genes. The mRNA of each one of this plurality of VGAM465 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM465 RNA, herein designated VGAM RNA, and which when bound by VGAM465 RNA causes inhibition of translation of respective one or more VGAM465 host target proteins.

[21490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM465 gene, herein designated VGAM GENE, on one or more VGAM465 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[21491] It is yet further appreciated that a function of VGAM465 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM465 correlate with, and may be deduced from, the identity of the host target genes which VGAM465 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21492] Nucleotide sequences of the VGAM465 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM465 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM465 are further described hereinbelow with reference to Table 1.

[21493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM465 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM465 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21494] As mentioned hereinabove with reference to Fig. 1, a function of VGAM465 gene, herein designated VGAM is inhibition of expression of VGAM465 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM465 correlate with, and may be deduced from, the identity of the target genes which VGAM465 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21495] GLI-Kruppel Family Member GLI2 (GLI2, Accession NM\_030379) is a VGAM465 host target gene. GLI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GLI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLI2 BINDING SITE, designated SEQ ID:24935, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21496] A function of VGAM465 is therefore inhibition of GLI-Kruppel Family Member GLI2 (GLI2, Accession

NM\_030379), a gene which may promote tax-dependent transcription of T-cell leukemia virus type 1 genes. Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLI2. The function of GLI2 has been established by previous studies. The GLI gene (OMIM Ref. No. 165220) was discovered and so-named by reason of its amplification in gliomas of the brain. Sequencing of GLI cDNA clones showed the presence of 5 tandem zinc fingers connected by histidine-cysteine links, which indicated that the gene belongs to the family of zinc finger genes related to Kruppel (Kr). The Drosophila gene Kr is a member of the gap class of segmentation genes; thoracic and anterior abdominal segments fail to form in Kr mutant embryos. This suggested to Ruppert et al. (1988) that other genes of this class might prove important in normal or disease states. Indeed, other genes important in neoplasia, such as NMYC (OMIM Ref. No. 164840), LMYC (OMIM Ref. No. 164850), HER2 (OMIM Ref. No. 164870), and NRAS (OMIM Ref. No. 164790), have been identified partly by their homology to previously identified oncogenes. Therefore, Ruppert et al. (1988) used a GLI cDNA fragment encoding the zinc finger region to isolate related

human sequences. Six distinct loci were identified in this manner. Partial sequencing revealed that each open reading frame was capable of encoding fingers with H-C links. Most of these sequences were found to be expressed in several adult tissues. Using DNA from human-rodent hybrid panels in hybridization studies with probes representing each of 6 distinct loci (identified as distinct by patterns of RNA expression and species conservation), Ruppert et al. (1988) demonstrated that the 6 loci are located on 5 different chromosomes: GLI2 was concordant with NMYC on chromosome 2; GLI3 with epidermal growth factor receptor (OMIM Ref. No. 131550) on chromosome 7; HKR1 and HKR2 with APOE (OMIM Ref. No. 107741) on chromosome 19; HKR3 with NRAS on chromosome 1; and HKR4 with MYC (OMIM Ref. No. 190080) on chromosome 8. Animal model experiments lend further support to the function of GLI2. Grachtchouk et al. (2000) showed that transgenic mice overexpressing Gli2 in cutaneous keratinocytes develop multiple basal cell carcinomas (BCCs). These results established Gli2 as a potent oncogene in skin and suggested a pivotal role for this transcription factor in the development of human BCC. Furthermore, they found that overexpression of Gli2 in skin results in

the activation of multiple Sonic hedgehog (SHH; 600725) target genes, a feature of human BCCs. They proposed that irrespective of the genetic alteration eliciting uncontrolled SHH signaling in human BCCs, GLI2 has a central role in the genesis of these tumors.

[21497] It is appreciated that the abovementioned animal model for GLI2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21498] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21499] Grachtchouk, M.; Mo, R.; Yu, S.; Zhang, X.; Sasaki, H.; Hui, C.; Dlugosz, A. A. : Basal cell carcinomas in mice overexpressing Gli2 in skin. (Letter) Nature Genet. 24: 216–217, 2000. ; and

[21500] Ruppert, J. M.; Kinzler, K. W.; Wong, A. J.; Bigner, S. H.; Kao, F.-T.; Law, M. L.; Seuanez, H. N.; O'Brien, S. J.; Vogelstein, B. : The GLI-Kruppel family of human genes. Molec. Cell.

[21501] Further studies establishing the function and utilities of GLI2 are found in John Hopkins OMIM database record ID 165230, and in cited publications numbered 46–4 and 45

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phenylalanine Hydroxylase (PAH, Accession NM\_000277) is another VGAM465 host target gene. PAH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAH BINDING SITE, designated SEQ ID:5824, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21502] Another function of VGAM465 is therefore inhibition of Phenylalanine Hydroxylase (PAH, Accession NM\_000277). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAH. XT3 (Accession NM\_020208) is another VGAM465 host target gene. XT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XT3 BINDING

SITE, designated SEQ ID:21444, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21503] Another function of VGAM465 is therefore inhibition of XT3 (Accession NM\_020208), a gene which is a Kidney-specific orphan transporter. Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3. The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM21.DKFZp762M136 (Accession XM\_035635) is another VGAM465 host target gene. DKFZp762M136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762M136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762M136 BINDING SITE, designated SEQ ID:32302, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21504] Another function of VGAM465 is therefore inhibition of

DKFZp762M136 (Accession XM\_035635). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762M136. FLJ20156 (Accession NM\_017691) is another VGAM465 host target gene. FLJ20156 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20156 BINDING SITE, designated SEQ ID:19247, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21505] Another function of VGAM465 is therefore inhibition of FLJ20156 (Accession NM\_017691). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20156. FLJ20489 (Accession NM\_017842) is another VGAM465 host target gene. FLJ20489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20489 BINDING SITE, designated SEQ ID:19505, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21506] Another function of VGAM465 is therefore inhibition of FLJ20489 (Accession NM\_017842). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20489. Glutamate Receptor Interacting Protein 1 (GRIP1, Accession XM\_047362) is another VGAM465 host target gene. GRIP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIP1 BINDING SITE, designated SEQ ID:34963, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21507] Another function of VGAM465 is therefore inhibition of Glutamate Receptor Interacting Protein 1 (GRIP1, Accession XM\_047362). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIP1. HT002

(Accession NM\_014066) is another VGAM465 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15279, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21508] Another function of VGAM465 is therefore inhibition of HT002 (Accession NM\_014066). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA0469 (Accession NM\_014851) is another VGAM465 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16892, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3176.

[21509] Another function of VGAM465 is therefore inhibition of KIAA0469 (Accession NM\_014851). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA1554 (Accession XM\_170834) is another VGAM465 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45615, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21510] Another function of VGAM465 is therefore inhibition of KIAA1554 (Accession XM\_170834). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1554. LOC146272 (Accession XM\_085396) is another VGAM465 host target gene. LOC146272 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146272, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146272 BINDING SITE, designated SEQ ID:38119, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21511] Another function of VGAM465 is therefore inhibition of LOC146272 (Accession XM\_085396). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146272. LOC92078 (Accession XM\_042684) is another VGAM465 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33747, to the nucleotide sequence of VGAM465 RNA, herein designated VGAM RNA, also designated SEQ ID:3176.

[21512] Another function of VGAM465 is therefore inhibition of LOC92078 (Accession XM\_042684). Accordingly, utilities of VGAM465 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC92078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 466 (VGAM466) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21513] VGAM466 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM466 was detected is described hereinabove with reference to Figs. 1–8.

[21514] VGAM466 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Autographa Californica Nucleopolyhedrovirus. VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21515] VGAM466 gene encodes a VGAM466 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM466 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM466 precursor RNA is designated SEQ

ID:452, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:452 is located at position 72494 relative to the genome of Autographa Californica Nucleopolyhedrovirus.

[21516] VGAM466 precursor RNA folds onto itself, forming VGAM466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21517] An enzyme complex designated DICER COMPLEX, `dices` the VGAM466 folded precursor RNA into VGAM466 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM466 RNA is designated SEQ ID:3177, and is provided hereinbelow with reference to the sequence

listing part.

[21518] VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM466 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21519] VGAM466 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM466 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM466 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21520] The complementary binding of VGAM466 RNA, herein designated VGAM RNA, to host target binding sites on VGAM466 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM466 host target RNA into VGAM466 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21521] It is appreciated that VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM466 host target genes. The mRNA of each one of this plurality of VGAM466 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM466 RNA, herein designated VGAM

RNA, and which when bound by VGAM466 RNA causes inhibition of translation of respective one or more VGAM466 host target proteins.

[21522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM466 gene, herein designated VGAM GENE, on one or more VGAM466 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21523] It is yet further appreciated that a function of VGAM466 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM466 include diagnosis, prevention and treatment of viral infection by Autographa Californica Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM466 correlate with, and may be deduced from, the identity of the host target genes which VGAM466 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21524] Nucleotide sequences of the VGAM466 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM466 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM466 are further described hereinbelow with reference to Table 1.

[21525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM466 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM466 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21526] As mentioned hereinabove with reference to Fig. 1, a function of VGAM466 gene, herein designated VGAM is

inhibition of expression of VGAM466 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM466 correlate with, and may be deduced from, the identity of the target genes which VGAM466 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21527] B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633) is a VGAM466 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6256, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21528] A function of VGAM466 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633). Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993) is another VGAM466 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21988, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21529] Another function of VGAM466 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993). Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A. BCLG (Accession NM\_030766) is another VGAM466 host target gene. BCLG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCLG BINDING SITE, designated SEQ ID:25052, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21530] Another function of VGAM466 is therefore inhibition of

BCLG (Accession NM\_030766). Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCLG. Norrie Disease (pseudoglioma) (NDP, Accession NM\_000266) is another VGAM466 host target gene. NDP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP BINDING SITE, designated SEQ ID:5809, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21531] Another function of VGAM466 is therefore inhibition of Norrie Disease (pseudoglioma) (NDP, Accession NM\_000266), a gene which may be involved in a pathway that regulates neural cell differentiation and proliferation. Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP. The function of NDP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM113.Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112) is another VGAM466 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15361, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21532] Another function of VGAM466 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.FLJ12595 (Accession NM\_024994) is another VGAM466 host target gene. FLJ12595 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ12595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12595 BINDING SITE, designated SEQ ID:24558, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21533] Another function of VGAM466 is therefore inhibition of FLJ12595 (Accession NM\_024994). Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12595. KIAA1078 (Accession XM\_036589) is another VGAM466 host target gene. KIAA1078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1078 BINDING SITE, designated SEQ ID:32473, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21534] Another function of VGAM466 is therefore inhibition of KIAA1078 (Accession XM\_036589). Accordingly, utilities

of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1078. Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM\_006814) is another VGAM466 host target gene. PSMF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMF1 BINDING SITE, designated SEQ ID:13690, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21535] Another function of VGAM466 is therefore inhibition of Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM\_006814). Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMF1. LOC144195 (Accession XM\_016498) is another VGAM466 host target gene. LOC144195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144195, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144195 BINDING SITE, designated SEQ ID:30266, to the nucleotide sequence of VGAM466 RNA, herein designated VGAM RNA, also designated SEQ ID:3177.

[21536] Another function of VGAM466 is therefore inhibition of LOC144195 (Accession XM\_016498). Accordingly, utilities of VGAM466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144195. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 467 (VGAM467) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21537] VGAM467 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM467 was detected is described hereinabove with reference to Figs. 1–8.

[21538] VGAM467 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Autographa Californica Nucleopolyhedrovirus. VGAM467 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21539] VGAM467 gene encodes a VGAM467 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM467 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM467 precursor RNA is designated SEQ ID:453, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:453 is located at position 73764 relative to the genome of Autographa Californica Nucleopolyhedrovirus.

[21540] VGAM467 precursor RNA folds onto itself, forming VGAM467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21541] An enzyme complex designated DICER COMPLEX, `dices` the VGAM467 folded precursor RNA into VGAM467 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM467 RNA is designated SEQ ID:3178, and is provided hereinbelow with reference to the sequence listing part.

[21542] VGAM467 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM467 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21543] VGAM467 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM467 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM467 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21544] The complementary binding of VGAM467 RNA, herein designated VGAM RNA, to host target binding sites on VGAM467 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM467 host target RNA into VGAM467 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[21545] It is appreciated that VGAM467 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM467 host target genes. The mRNA of each one of this plurality of VGAM467 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM467 RNA, herein designated VGAM RNA, and which when bound by VGAM467 RNA causes inhibition of translation of respective one or more VGAM467 host target proteins.

[21546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM467 gene, herein designated VGAM GENE, on one or more VGAM467 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21547] It is yet further appreciated that a function of VGAM467 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of viral infection by Autographa Californica Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM467 correlate with, and may be deduced from, the identity of the host target genes which VGAM467 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21548] Nucleotide sequences of the VGAM467 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM467 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM467 are further described hereinbelow with reference to Table 1.

[21549] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM467 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM467 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21550] As mentioned hereinabove with reference to Fig. 1, a function of VGAM467 gene, herein designated VGAM is inhibition of expression of VGAM467 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM467 correlate with, and may be deduced from, the identity of the target genes which VGAM467 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21551] Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129) is a VGAM467 host target gene. NEDD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4 BINDING SITE, designated SEQ ID:34693, to the nucleotide sequence of

VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21552] A function of VGAM467 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129), a gene which ubiquitinates regulatory proteins involved in transcription. Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4. The function of NEDD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209. Transmembrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM\_020182) is another VGAM467 host target gene. TMEPAI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMEPAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:21405, to the nucleotide sequence of VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21553] Another function of VGAM467 is therefore inhibition of Transmembrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM\_020182). Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI. DKFZp761G2113 (Accession XM\_046017) is another VGAM467 host target gene. DKFZp761G2113 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp761G2113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G2113 BINDING SITE, designated SEQ ID:34642, to the nucleotide sequence of VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21554] Another function of VGAM467 is therefore inhibition of DKFZp761G2113 (Accession XM\_046017). Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G2113. FLJ12517 (Accession NM\_023007) is another VGAM467 host target gene. FLJ12517 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by FLJ12517, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12517 BINDING SITE, designated SEQ ID:23270, to the nucleotide sequence of VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21555] Another function of VGAM467 is therefore inhibition of FLJ12517 (Accession NM\_023007). Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12517. MGC15437 (Accession NM\_032873) is another VGAM467 host target gene. MGC15437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15437 BINDING SITE, designated SEQ ID:26688, to the nucleotide sequence of VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21556] Another function of VGAM467 is therefore inhibition of MGC15437 (Accession NM\_032873). Accordingly, utilities

of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15437. LOC144893 (Accession XM\_096687) is another VGAM467 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144893 BINDING SITE, designated SEQ ID:40458, to the nucleotide sequence of VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21557] Another function of VGAM467 is therefore inhibition of LOC144893 (Accession XM\_096687). Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC221596 (Accession XM\_166331) is another VGAM467 host target gene. LOC221596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221596 BINDING SITE, designated SEQ ID:44174, to the nucleotide sequence of VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21558] Another function of VGAM467 is therefore inhibition of LOC221596 (Accession XM\_166331). Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221596. LOC57821 (Accession NM\_021179) is another VGAM467 host target gene. LOC57821 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC57821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57821 BINDING SITE, designated SEQ ID:22151, to the nucleotide sequence of VGAM467 RNA, herein designated VGAM RNA, also designated SEQ ID:3178.

[21559] Another function of VGAM467 is therefore inhibition of LOC57821 (Accession NM\_021179). Accordingly, utilities of VGAM467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57821. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 468 (VGAM468) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21560] VGAM468 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM468 was detected is described hereinabove with reference to Figs. 1–8.

[21561] VGAM468 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21562] VGAM468 gene encodes a VGAM468 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM468 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM468 precursor RNA is designated SEQ ID:454, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:454 is located at position 33653 relative to the genome of

## Equine Herpesvirus 2.

[21563] VGAM468 precursor RNA folds onto itself, forming VGAM468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21564] An enzyme complex designated DICER COMPLEX, `dices` the VGAM468 folded precursor RNA into VGAM468 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM468 RNA is designated SEQ ID:3179, and is provided hereinbelow with reference to the sequence listing part.

[21565] VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM468 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21566] VGAM468 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM468 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM468 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21567] The complementary binding of VGAM468 RNA, herein designated VGAM RNA, to host target binding sites on VGAM468 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM468 host target RNA into VGAM468 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21568] It is appreciated that VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM468 host target genes. The mRNA of each one of this plurality of VGAM468 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM468 RNA, herein designated VGAM RNA, and which when bound by VGAM468 RNA causes inhibition of translation of respective one or more VGAM468 host target proteins.

[21569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM468 gene, herein designated VGAM GENE, on one or more VGAM468 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21570] It is yet further appreciated that a function of VGAM468 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM468 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM468 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM468 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21571] Nucleotide sequences of the VGAM468 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM468 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM468 are further described hereinbelow with reference to Table 1.

[21572] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM468 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM468 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21573] As mentioned hereinabove with reference to Fig. 1, a function of VGAM468 gene, herein designated VGAM is inhibition of expression of VGAM468 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM468 correlate with, and may be deduced

from, the identity of the target genes which VGAM468 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21574] RAB20, Member RAS Oncogene Family (RAB20, Accession NM\_017817) is a VGAM468 host target gene. RAB20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB20 BINDING SITE, designated SEQ ID:19462, to the nucleotide sequence of VGAM468 RNA, herein designated VGAM RNA, also designated SEQ ID:3179.

[21575] A function of VGAM468 is therefore inhibition of RAB20, Member RAS Oncogene Family (RAB20, Accession NM\_017817). Accordingly, utilities of VGAM468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB20. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 469 (VGAM469) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host

target genes is known in the art.

[21576] VGAM469 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM469 was detected is described hereinabove with reference to Figs. 1–8.

[21577] VGAM469 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM469 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21578] VGAM469 gene encodes a VGAM469 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM469 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM469 precursor RNA is designated SEQ ID:455, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:455 is located at position 156830 relative to the genome of Equine Herpesvirus 2.

[21579] VGAM469 precursor RNA folds onto itself, forming VGAM469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[21580] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM469 folded precursor RNA into VGAM469 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 42%) nucleotide se-  
quence of VGAM469 RNA is designated SEQ ID:3180, and  
is provided hereinbelow with reference to the sequence  
listing part.

[21581] VGAM469 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM469 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM469 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[21582] VGAM469 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM469 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM469 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5' UTR regions.

[21583] The complementary binding of VGAM469 RNA, herein designated VGAM RNA, to host target binding sites on VGAM469 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM469 host target RNA into VGAM469 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21584] It is appreciated that VGAM469 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM469 host target genes. The mRNA of each one of this plurality of VGAM469 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM469 RNA, herein designated VGAM RNA, and which when bound by VGAM469 RNA causes inhibition of translation of respective one or more VGAM469 host target proteins.

[21585] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM469 gene, herein designated VGAM GENE, on one or

more VGAM469 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21586] It is yet further appreciated that a function of VGAM469 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM469 correlate with, and may be deduced from, the identity of the host target genes which VGAM469 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [21587] Nucleotide sequences of the VGAM469 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM469 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM469 are further described hereinbelow with reference to Table 1.
- [21588] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM469 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM469 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21589] As mentioned hereinabove with reference to Fig. 1, a function of VGAM469 gene, herein designated VGAM is inhibition of expression of VGAM469 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM469 correlate with, and may be deduced from, the identity of the target genes which VGAM469 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [21590] Chaperone, ABC1 Activity of Bc1 Complex Like (*S. pombe*)

(CABC1, Accession NM\_020247) is a VGAM469 host target gene. CABC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CABC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CABC1 BINDING SITE, designated SEQ ID:21541, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21591] A function of VGAM469 is therefore inhibition of Chaperone, ABC1 Activity of Bc1 Complex Like (*S. pombe*) (CABC1, Accession NM\_020247). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABC1. F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM\_012308) is another VGAM469 host target gene. FBXL11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL11 BINDING SITE, designated SEQ

ID:14682, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21592] Another function of VGAM469 is therefore inhibition of F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM\_012308), a gene which are BTB/POZ domain-containing zinc finger proteins implicated in oncogenesis. Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL11. The function of FBXL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404. Mitogen-activated Protein Kinase Kinase Kinase 1 (MAP3K1, Accession XM\_042066) is another VGAM469 host target gene. MAP3K1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAP3K1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K1 BINDING SITE, designated SEQ ID:33682, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3180.

[21593] Another function of VGAM469 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 1 (MAP3K1, Accession XM\_042066), a gene which can phosphorylate and activate mapkk 1 and mapkk 2 (mek1/mek2) which leads to phosphorylation of map kinases. it is also a highly efficient activator of the jnk cascade. Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K1. The function of MAP3K1 has been established by previous studies. Gamma interferon (IFNG; 147570) induces a number of genes, including MEKK1, to upregulate cellular responses by using specific transcription factors and the cognate elements (Roy et al., 2002). Lu et al. (2002) found that the PHD domain of MEKK1, a RING finger-like structure, exhibited E3 ubiquitin ligase activity toward ERK2 (OMIM Ref. No. 176948) in vitro and in vivo. Moreover, both MEKK1 kinase activity and the docking motif on ERK1 (OMIM Ref. No. 601795)/ERK2 were involved in ERK1/ERK2 ubiquitination. Significantly, cells expressing ERK2 with the docking motif mutation were resistant to sorbitol-induced apoptosis. Therefore, MEKK1 functions not only as an upstream acti-

vator of ERK and JNK (see OMIM Ref. No. 601158) through its kinase domain, but also as an E3 ligase through its PHD domain, providing a negative regulatory mechanism for decreasing ERK1/ERK2 activity. Animal model experiments lend further support to the function of MAP3K1. Yujiri et al. (1998) targeted disruption of the gene encoding Mekk1 to define its function in the regulation of MAP kinase pathways and cell survival. Mekk1  $-/-$  embryonic stem cells from mice had lost or altered responses of Jnk to microtubule disruption and cold stress but activated Jnk normally in response to heat shock, anisomycin, and ultraviolet irradiation. Activation of Jnk was lost and that of Erk was diminished in response to hyperosmolarity and serum factors in Mekk1  $-/-$  cells. Loss of Mekk1 expression resulted in a greater apoptotic response of cells to hyperosmolarity and microtubule disruption. When activated by specific stresses that alter cell shape and the cytoskeleton, Mekk1 signals to protect cells from apoptosis

[21594] It is appreciated that the abovementioned animal model for MAP3K1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21595] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [21597] Yujiri, T.; Sather, S.; Fanger, G. R.; Johnson, G. L. : Role of MEKK1 in cell survival and activation of JNK and ERK pathways defined by targeted gene disruption. Science 282: 1911–1914, 1.
- [21598] Further studies establishing the function and utilities of MAP3K1 are found in John Hopkins OMIM database record ID 600982, and in cited publications numbered 781 and 7884–7885 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AWP1 (Accession NM\_019006) is another VGAM469 host target gene. AWP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AWP1 BINDING SITE, designated SEQ ID:21078, to the nucleotide sequence of VGAM469 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3180.

[21599] Another function of VGAM469 is therefore inhibition of AWP1 (Accession NM\_019006). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AWP1. DCNP1 (Accession NM\_130848) is another VGAM469 host target gene. DCNP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DCNP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCNP1 BINDING SITE, designated SEQ ID:28385, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21600] Another function of VGAM469 is therefore inhibition of DCNP1 (Accession NM\_130848). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCNP1. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM469 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA en-

coded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16163, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21601] Another function of VGAM469 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DREV1 (Accession NM\_016025) is another VGAM469 host target gene. DREV1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DREV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DREV1 BINDING SITE, designated SEQ ID:18108, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21602] Another function of VGAM469 is therefore inhibition of

DREV1 (Accession NM\_016025). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DREV1. FLJ10209 (Accession NM\_018026) is another VGAM469 host target gene. FLJ10209 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10209 BINDING SITE, designated SEQ ID:19768, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21603] Another function of VGAM469 is therefore inhibition of FLJ10209 (Accession NM\_018026). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10209. FLJ20401 (Accession NM\_017805) is another VGAM469 host target gene. FLJ20401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20401 BINDING SITE, designated SEQ ID:19448, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21604] Another function of VGAM469 is therefore inhibition of FLJ20401 (Accession NM\_017805). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20401. FLJ22529 (Accession NM\_024789) is another VGAM469 host target gene. FLJ22529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22529 BINDING SITE, designated SEQ ID:24170, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21605] Another function of VGAM469 is therefore inhibition of FLJ22529 (Accession NM\_024789). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22529. LCHN (Accession XM\_098615) is another VGAM469 host

target gene. LCHN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LCHN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCHN BINDING SITE, designated SEQ ID:41729, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21606] Another function of VGAM469 is therefore inhibition of LCHN (Accession XM\_098615). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCHN. MGC3113 (Accession NM\_024035) is another VGAM469 host target gene. MGC3113 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3113 BINDING SITE, designated SEQ ID:23469, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21607] Another function of VGAM469 is therefore inhibition of MGC3113 (Accession NM\_024035). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3113. Mucin 16 (MUC16, Accession XM\_018353) is another VGAM469 host target gene. MUC16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MUC16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC16 BINDING SITE, designated SEQ ID:30356, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21608] Another function of VGAM469 is therefore inhibition of Mucin 16 (MUC16, Accession XM\_018353). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC16. Myosin, Heavy Polypeptide 7B, Cardiac Muscle, Beta (MYH7B, Accession XM\_047196) is another VGAM469 host target gene. MYH7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYH7B, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH7B BINDING SITE, designated SEQ ID:34909, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21609] Another function of VGAM469 is therefore inhibition of Myosin, Heavy Polypeptide 7B, Cardiac Muscle, Beta (MYH7B, Accession XM\_047196). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH7B. PCTAIRE2BP (Accession XM\_047341) is another VGAM469 host target gene. PCTAIRE2BP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCTAIRE2BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTAIRE2BP BINDING SITE, designated SEQ ID:34952, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21610] Another function of VGAM469 is therefore inhibition of PCTAIRE2BP (Accession XM\_047341). Accordingly, utilities

of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PC-TAIRE2BP. SEC8 (Accession NM\_021807) is another VGAM469 host target gene. SEC8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC8 BINDING SITE, designated SEQ ID:22362, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21611] Another function of VGAM469 is therefore inhibition of SEC8 (Accession NM\_021807). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC8. SIMRP7 (Accession XM\_166462) is another VGAM469 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated

SEQ ID:44372, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21612] Another function of VGAM469 is therefore inhibition of SIMRP7 (Accession XM\_166462). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7. SS-56 (Accession XM\_006063) is another VGAM469 host target gene. SS-56 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SS-56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:29990, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21613] Another function of VGAM469 is therefore inhibition of SS-56 (Accession XM\_006063). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS-56. LOC222962 (Accession XM\_167291) is another VGAM469 host target gene. LOC222962 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44631, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21614] Another function of VGAM469 is therefore inhibition of LOC222962 (Accession XM\_167291). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. LOC255975 (Accession XM\_171083) is another VGAM469 host target gene. LOC255975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:45889, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21615] Another function of VGAM469 is therefore inhibition of

LOC255975 (Accession XM\_171083). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975. LOC256401 (Accession XM\_171149) is another VGAM469 host target gene. LOC256401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256401 BINDING SITE, designated SEQ ID:45947, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21616] Another function of VGAM469 is therefore inhibition of LOC256401 (Accession XM\_171149). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256401. LOC90249 (Accession XM\_030300) is another VGAM469 host target gene. LOC90249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC90249 BINDING SITE, designated SEQ ID:31014, to the nucleotide sequence of VGAM469 RNA, herein designated VGAM RNA, also designated SEQ ID:3180.

[21617] Another function of VGAM469 is therefore inhibition of LOC90249 (Accession XM\_030300). Accordingly, utilities of VGAM469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 470 (VGAM470) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21618] VGAM470 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM470 was detected is described hereinabove with reference to Figs. 1–8.

[21619] VGAM470 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[21620] VGAM470 gene encodes a VGAM470 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM470 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM470 precursor RNA is designated SEQ ID:456, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:456 is located at position 45550 relative to the genome of African Swine Fever Virus.

[21621] VGAM470 precursor RNA folds onto itself, forming VGAM470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21622] An enzyme complex designated DICER COMPLEX, `dices` the VGAM470 folded precursor RNA into VGAM470 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM470 RNA is designated SEQ ID:3181, and is provided hereinbelow with reference to the sequence listing part.

[21623] VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM470 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21624] VGAM470 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM470 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM470 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21625] The complementary binding of VGAM470 RNA, herein designated VGAM RNA, to host target binding sites on VGAM470 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM470 host target RNA into VGAM470 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21626] It is appreciated that VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM470 host target genes. The mRNA of each one of this plurality of VGAM470 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM470 RNA, herein designated VGAM RNA, and which when bound by VGAM470 RNA causes inhibition of translation of respective one or more VGAM470 host target proteins.

[21627] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM470 gene, herein designated VGAM GENE, on one or more VGAM470 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21628] It is yet further appreciated that a function of VGAM470 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM470 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM470 correlate with, and may be deduced from, the identity of the host target genes which VGAM470 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21629] Nucleotide sequences of the VGAM470 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM470 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM470 are further described hereinbelow with reference to Table 1.

[21630] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM470 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM470 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21631] As mentioned hereinabove with reference to Fig. 1, a function of VGAM470 gene, herein designated VGAM is inhibition of expression of VGAM470 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM470 correlate with, and may be deduced from, the identity of the target genes which VGAM470 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21632] Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM\_005670) is a VGAM470 host target gene. EPM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPM2A BINDING SITE, designated SEQ ID:12228, to the nucleotide sequence of VGAM470 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3181.

[21633] A function of VGAM470 is therefore inhibition of Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM\_005670), a gene which Laforin; protein tyrosine phosphatase that may have role in glycogen metabolism. Accordingly, utilities of VGAM470 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPM2A. The function of EPM2A has been established by previous studies. In the Lafora type, onset takes the form of grand mal seizures and/or myoclonus at about age 15 years. Rapid and severe mental deterioration ensues, often with psychotic features. Survival is short, less than 10 years after onset. Histologic study of the brain shows Lafora bodies (which may also be demonstrable on muscle and liver biopsy). Intracellular Lafora bodies suggesting amyloid are found in the brain, and similar inclusions in the cells of the heart and liver (Harriman and Millar, 1955). The Lafora material has the properties of an acid mucopolysaccharide. Yokoi et al. (1968) arrived at a preliminary conclusion that the Lafora body is polyglucosan in nature. They pictured the existence of an enzyme defect which leads to deposition of polyglucosans near their site of synthesis in the agran-

ular endoplasmic reticulum. Schwarz and Yanoff (1965) described a brother and sister, offspring of a one-and-one-half cousin marriage, with this disease. Seizures began at age 15 in the boy with slowly progressive motor and mental deterioration leading to death at age 23.5 years. The sister's seizures began at age 14 years and progression to dementia and blindness occurred, with death at age 19. Intra- and extracellular Lafora bodies were found in the CNS, retina, axis cylinders of spinal nerves, heart muscle, liver cells, and striated muscle fibers. Diagnosis by liver or muscle biopsy was proposed. Busard et al. (1986, 1987) demonstrated that the diagnosis can be made reliably on axillary skin biopsy; all patients show typical periodic acid-Schiff (PAS)-positive inclusions in the myoepithelial cells of the secretory acini of the apocrine glands and/or in the cells of the eccrine duct. The method has no value for carrier detection. In cultured fibroblasts, Fluharty et al. (1970) described bodies which may be the equivalent of the Lafora body observed histologically. Sarlin et al. (1960) claimed that electroencephalographic abnormalities distinguished heterozygotes from homozygous normals. Norio and Koskiniemi (1979), as well as others, have concluded that there are 3 types of

what they termed progressive myoclonic epilepsy (PME). The Lafora type shows onset of grand mal seizures and/or myoclonus around the fifteenth year of life; rapid and severe mental deterioration, often with psychotic symptoms; short survival; histologic finding of Lafora bodies; and autosomal recessive inheritance. The Unverricht–Lundborg type (EPM1; 254800), which is frequent in Finland, has onset around the tenth year; variable severity; progressive incapacitation from myoclonus associated with mild mental symptoms; variable survival; 'degenerative' histologic changes; and autosomal recessive inheritance. A dominant form, to which Hartung's name is attached (see OMIM Ref. No. 159600), has been described. By linkage studies in 3 Italian families with Lafora disease, Lehesjoki et al. (1992) demonstrated that the gene is located at a locus other than that for the Unverricht–Lundborg type on chromosome 21q22.3. Serratosa et al. (1995) studied linkage in 9 families in which Lafora disease had been proven by biopsy in at least 1 member. Using microsatellite markers spaced an average of 13 cM apart, they used linkage analysis in all 9 families and homozygosity mapping in 4 consanguineous families to assign the gene for Lafora disease to 6q23–q25. An extended pedigree with 5 affected

members independently proved linkage. The multipoint 1-lod unit support interval covered a 2.5-cM region surrounding D6S403. Homozygosity mapping defined a 17-cM region in 6q23-q25 flanked by D6S292 and D6S420. The 9 families with a total of 19 patients affected with Lafora disease originated from the United States, Spain, Palestine, and Iran. Maddox et al. (1997) studied a 2-generation family in which a recombination event reduced the Lafora critical region to a 4-cM interval flanked by markers D6S308 and D6S311. Sainz et al. (1997) narrowed the assignment of the MELF locus within 6q24 by study of recombinants and homozygosities. Ganesh et al. (2000) cloned and expressed the full-length 38-kD laforin protein in transfected cells. Recombinant laforin was able to hydrolyze phosphotyrosine as well as phosphoserine/threonine substrates, demonstrating that laforin is an active dual-specificity phosphatase. Biochemical, immunofluorescence, and ultrastructural studies on transfected HeLa cells revealed that laforin is a cytoplasmic protein associated with polyribosomes. Expression of 2 proteins with missense mutations seen in EPM2A patients resulted in ubiquitin-positive perinuclear aggregates, suggesting that these were misfolded proteins targeted for degradation.

The authors suggested that laforin is involved in translational regulation and that protein misfolding may be one of the molecular bases of the Lafora disease phenotype caused by missense mutations in the EPM2A gene.

Gomez-Garre et al. (2000) reported the complete coding sequence of the EPM2A gene, including the ATG initiation codon region. They used SSCP analysis of the 4 exons in 34 unrelated patients with Lafora disease and identified EPM2A mutations in 27 (79%) of them (49 of 68 chromosomes, or 72%). The patients originated from Spain, Italy, Australia, Holland, the US, North Africa, Turkey, and France. A total of 20 different EPM2A mutations, 11 of them novel, were characterized. The authors summarized 25 EPM2A mutations distributed throughout the gene in 44 unrelated Lafora disease patients. The mutations included 10 deletions of different sizes, 9 missense mutations, 3 nonsense mutations, and 3 frameshift mutations. The R241X mutation (254780.0008) was encountered in almost 40% of the probands. In 5 Lafora disease families (13% of the families studied), Gomez-Garre et al. (2000) excluded linkage to the EPM2A gene region.

- [21637] Further studies establishing the function and utilities of EPM2A are found in John Hopkins OMIM database record ID 254780, and in cited publications numbered 9099–9107, 9220–922 and 9229–9228 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1493 (Accession XM\_034415) is another VGAM470 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32094, to the nucleotide sequence of VGAM470 RNA, herein designated

VGAM RNA, also designated SEQ ID:3181.

[21638] Another function of VGAM470 is therefore inhibition of KIAA1493 (Accession XM\_034415). Accordingly, utilities of VGAM470 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. KR18 (Accession NM\_033288) is another VGAM470 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27119, to the nucleotide sequence of VGAM470 RNA, herein designated VGAM RNA, also designated SEQ ID:3181.

[21639] Another function of VGAM470 is therefore inhibition of KR18 (Accession NM\_033288). Accordingly, utilities of VGAM470 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. LOC169166 (Accession XM\_095541) is another VGAM470 host target gene. LOC169166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169166, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169166 BINDING SITE, designated SEQ ID:40272, to the nucleotide sequence of VGAM470 RNA, herein designated VGAM RNA, also designated SEQ ID:3181.

[21640] Another function of VGAM470 is therefore inhibition of LOC169166 (Accession XM\_095541). Accordingly, utilities of VGAM470 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169166. LOC200301 (Accession XM\_114197) is another VGAM470 host target gene. LOC200301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:42783, to the nucleotide sequence of VGAM470 RNA, herein designated VGAM RNA, also designated SEQ ID:3181.

[21641] Another function of VGAM470 is therefore inhibition of LOC200301 (Accession XM\_114197). Accordingly, utilities of VGAM470 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC200301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 471 (VGAM471) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21642] VGAM471 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM471 was detected is described hereinabove with reference to Figs. 1–8.

[21643] VGAM471 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM471 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21644] VGAM471 gene encodes a VGAM471 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM471 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM471 precursor RNA is designated SEQ

ID:457, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:457 is located at position 135287 relative to the genome of Human Herpesvirus 6.

[21645] VGAM471 precursor RNA folds onto itself, forming VGAM471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21646] An enzyme complex designated DICER COMPLEX, `dices` the VGAM471 folded precursor RNA into VGAM471 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM471 RNA is designated SEQ ID:3182, and is provided hereinbelow with reference to the sequence

listing part.

[21647] VGAM471 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM471 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21648] VGAM471 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM471 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM471 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21649] The complementary binding of VGAM471 RNA, herein designated VGAM RNA, to host target binding sites on VGAM471 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM471 host target RNA into VGAM471 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21650] It is appreciated that VGAM471 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM471 host target genes. The mRNA of each one of this plurality of VGAM471 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM471 RNA, herein designated VGAM

RNA, and which when bound by VGAM471 RNA causes inhibition of translation of respective one or more VGAM471 host target proteins.

[21651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM471 gene, herein designated VGAM GENE, on one or more VGAM471 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21652] It is yet further appreciated that a function of VGAM471 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM471 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM471 correlate with, and may be deduced from, the identity of the host target genes which VGAM471 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21653] Nucleotide sequences of the VGAM471 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM471 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM471 are further described hereinbelow with reference to Table 1.

[21654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM471 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM471 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21655] As mentioned hereinabove with reference to Fig. 1, a function of VGAM471 gene, herein designated VGAM is

inhibition of expression of VGAM471 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM471 correlate with, and may be deduced from, the identity of the target genes which VGAM471 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21656] Bone Morphogenetic Protein 1 (BMP1, Accession NM\_006131) is a VGAM471 host target gene. BMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP1 BINDING SITE, designated SEQ ID:12770, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21657] A function of VGAM471 is therefore inhibition of Bone Morphogenetic Protein 1 (BMP1, Accession NM\_006131), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1. The function of BMP1 and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.Dihydropyrimidinase-like 2 (DPYSL2, Accession NM\_001386) is another VGAM471 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, designated SEQ ID:7061, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21658] Another function of VGAM471 is therefore inhibition of Dihydropyrimidinase-like 2 (DPYSL2, Accession NM\_001386), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2. The function of DPYSL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.Inhibitor of Kappa Light Polypeptide Gene En-

hancer In B-cells, Kinase Gamma (IKBKG, Accession NM\_003639) is another VGAM471 host target gene. IKBKG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IKBKG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IKBKG BINDING SITE, designated SEQ ID:9711, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21659] Another function of VGAM471 is therefore inhibition of Inhibitor of Kappa Light Polypeptide Gene Enhancer In B-cells, Kinase Gamma (IKBKG, Accession NM\_003639), a gene which regulatory subunit part of the ikk-signalosome complex activation. also considered to be a mediator for tax activation of nf-kappa-b. could be implicated in nf-kappa-b-mediated protection from cytokine toxicity. Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IKBKG. The function of IKBKG has been established by previous studies. Yamaoka et al. (1998) characterized a mutant cell line, 5R, originally isolated as a cellular flat variant of Rat-1 fibroblasts trans-

formed by the Tax protein of human T-cell leukemia virus type 1 (OMIM Ref. No. HTLV-1). The 5R cell line was unresponsive to all tested NF-kappa-B (NFKB; OMIM Ref. No. 164011)-activating stimuli. Using a genetic complementation approach, Yamaoka et al. (1998) cloned a component of the I-kappa-B kinase complex that they termed NEMO for 'NF-kappa-B essential modulator' from 5R cells. The 2.8-kb NEMO cDNA encodes a 412-amino acid protein that is acidic, rich in glutamic acid and glutamine residues (each 13%), and contains a leucine zipper motif at amino acids 315-342. Yamaoka et al. (1998) determined that the defective phenotype of 5R cells resulted from the absence of the NEMO protein. NEMO also complemented the 1.3E2 mutant cell line, in which NFKB is not activated in response to a large set of stimuli. NEMO interacted with IKK2 (IKK-beta; 603258), but not with IKK1 (IKK-alpha; 600664). Aradhya et al. (2001) identified a truncated copy of NEMO (delta-NEMO), which maps 22 kb distal to NEMO and contains only exons 3 through 10. A sequence of 26 kb 3-prime of the NEMO coding sequence is also present in the same position relative to the delta-NEMO locus, bringing the total length of the duplication to 35.5 kb. The LAGE2 gene is also located within this dupli-

cated region, and a similar but unique LAGE1 gene is located just distal to the duplicated loci. Mapping and sequence information indicated that the duplicated regions are in opposite orientation. Analysis of the great apes suggested that the NEMO/LAGE2 duplication occurred after divergence of the lineage leading to present day humans, chimpanzees, and gorillas, 10 to 15 million years ago. Despite this substantial evolutionary history, only 22 single-nucleotide differences exist between the 2 copies over the entire 35.5 kb, making the duplications more than 99% identical. This high sequence identity and the inverted orientations of the 2 copies, along with duplications of smaller internal sections within each copy, predispose this region to various genomic alterations. Aradhya et al. (2001) detected 4 rearrangements that involved NEMO, delta-NEMO, or LAGE1 and LAGE2. The authors hypothesized that the susceptibility of this complex genomic region to various types of pathogenic and polymorphic rearrangements may underlie the recurrent lethal deletion associated with IP Animal model experiments lend further support to the function of IKBKG. Schmidt-Supprian et al. (2000) found that disruption of the mouse *Ikbkg* gene produces male embryonic lethality, completely

blocks NF-kappa-B activation by proinflammatory cytokines, and interferes with the generation and/or persistence of lymphocytes. Heterozygous female mice developed patchy skin lesions with massive granulocyte infiltration and hyperproliferation and increased apoptosis of keratinocytes. Diseased animals presented severe growth retardation and early mortality. Surviving mice recovered almost completely, presumably through clearing the skin of Ikbkg-deficient keratinocytes. The authors stated that male lethality and strikingly similar skin lesions in heterozygous females are hallmarks of the human genetic disorder IP2

[21660] It is appreciated that the abovementioned animal model for IKBKG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21661] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21662] Schmidt-Supprian, M.; Bloch, W.; Courtois, G.; Addicks, K.; Israel, A.; Rajewsky, K.; Pasparakis, M. : NEMO/IKK-gamma-deficient mice model incontinentia pigmenti. Molec. Cell 5: 981-992, 2000. ; and

[21663] Aradhya, S.; Bardaro, T.; Galgoczy, P.; Yamagata, T.; Esposito, T.; Patlan, H.; Ciccodicola, A.; Munnich, A.; Kenwick, S.; Platzer, M.; D'Urso, M.; Nelson, D. L. : Multiple pathogenic.

[21664] Further studies establishing the function and utilities of IKBKG are found in John Hopkins OMIM database record ID 300248, and in cited publications numbered 9191–9192, 919 and 9195–9209 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM\_138768) is another VGAM471 host target gene. MYEOV BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYEOV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYEOV BINDING SITE, designated SEQ ID:29001, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21665] Another function of VGAM471 is therefore inhibition of Myeloma Overexpressed Gene (in a subset of t(11;14)

Positive Multiple Myelomas) (MYEOV, Accession NM\_138768), a gene which is encoded by MYELOMA OVEREXPRESSED GENE. Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYEOV. The function of MYEOV has been established by previous studies. By cloning gastric carcinoma tumor DNA into phage vectors, probing with human Alu repetitive sequences, and exon-trap analysis, Janssen et al. (2000) isolated a cDNA encoding MYEOV (myeloma overexpressed gene). Sequence analysis predicted that the 313-amino acid protein contains no known functional motifs except for an RNP1 motif typical of RNA-binding proteins and a leucine-isoleucine tail similar to cytoplasmically exposed membrane proteins with a C-terminal membrane anchor. Northern blot analysis detected a major 2.8-kb and a minor 3.5-kb transcript in various tumor cell lines. In 3 of 7 multiple myeloma cell lines with a t(11;14)(q13;q32) and cyclin D1 (CCND1; 168461) overexpression, Northern blot analysis determined that MYEOV was overexpressed. In all 7 cell lines, the breakpoint was mapped to the 360-kb region between the 2 genes. MYEOV overexpression was associated with the juxtaposition of an enhancer to the

MYEOV gene. Using FISH, Janssen et al. (2000) mapped the MYEOV gene to 11q13.1, 360 kb centromeric to CCND1. DNA amplifications at 11q13 are frequently observed in esophageal squamous cell carcinoma (OMIM Ref. No. 133239) and correlate with a malignant phenotype. Although this amplicon spans a region of several megabases and harbors numerous genes, CCND1 and EMS1 (OMIM Ref. No. 164765) are thought to be the relevant candidates in esophageal carcinoma. Janssen et al. (2002) investigated whether the putative transforming gene MYEOV, mapping 360 kb centromeric to CCND1 and activated concomitantly with CCND1 in a subset of t(11;14)(q13;q32) positive multiple myeloma cell lines, represents a target of 11q13 amplification in esophageal carcinoma. They tested 31 esophageal squamous cell carcinoma cell lines and 48 primary tumors for copy number levels of MYEOV and demonstrated that MYEOV was always coamplified with CCND1. However, its activation was sometimes inhibited by an epigenetic mechanism.

[21666] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21667] Janssen, J. W. G.; Imoto, I.; Inoue, J.; Shimada, Y.; Ueda,

M.; Imamura, M.; Bartram, C. R.; Inazawa, J. : MYEOV, a gene at 11q13, is coamplified with CCND1, but epigenetically inactivated in a subset of esophageal squamous cell carcinomas. J. Hum. Genet. 47: 460–464, 2002. ; and

[21668] Janssen, J. W. G.; Vaandrager, J.–W.; Heuser, T.; Jauch, A.; Kluin, P. M.; Geelen, E.; Bergsagel, P. L.; Kuehl, W. M.; Drexler, H. G.; Otsuki, T.; Bartram, C. R.; Schuuring, E. : Concu.

[21669] Further studies establishing the function and utilities of MYEOV are found in John Hopkins OMIM database record ID 605625, and in cited publications numbered 6958–6959 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet–derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM\_038350) is another VGAM471 host target gene. PDGFRB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRB BINDING SITE, designated SEQ ID:32812, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA,

also designated SEQ ID:3182.

[21670] Another function of VGAM471 is therefore inhibition of Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM\_038350), a gene which Platelet-derived growth factor receptor beta chain; tyrosine kinase receptor. Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRB. The function of PDGFRB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM\_001056) is another VGAM471 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:6719, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21671] Another function of VGAM471 is therefore inhibition of

Sulfotransferase Family, Cytosolic, 1C, Member 1

(SULT1C1, Accession NM\_001056). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C1. DKFZP566B183 (Accession NM\_015509) is another VGAM471 host target gene. DKFZP566B183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566B183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566B183 BINDING SITE, designated SEQ ID:17767, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21672] Another function of VGAM471 is therefore inhibition of DKFZP566B183 (Accession NM\_015509). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566B183. DNAM-1 (Accession NM\_006566) is another VGAM471 host target gene. DNAM-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAM-1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAM-1 BINDING SITE, designated SEQ ID:13336, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21673] Another function of VGAM471 is therefore inhibition of DNAM-1 (Accession NM\_006566). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAM-1. FLJ10751 (Accession NM\_018205) is another VGAM471 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20093 and SEQ ID:20192 respectively, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21674] Another function of VGAM471 is therefore inhibition of FLJ10751 (Accession NM\_018205). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ10751. KIAA1538 (Accession XM\_049474) is another VGAM471 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35429, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21675] Another function of VGAM471 is therefore inhibition of KIAA1538 (Accession XM\_049474). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. LEC3 (Accession NM\_015236) is another VGAM471 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17565, to the nucleotide sequence of

VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21676] Another function of VGAM471 is therefore inhibition of LEC3 (Accession NM\_015236). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. SNRK (Accession NM\_017719) is another VGAM471 host target gene. SNRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRK BINDING SITE, designated SEQ ID:19307, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21677] Another function of VGAM471 is therefore inhibition of SNRK (Accession NM\_017719). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRK. LOC151195 (Accession XM\_087125) is another VGAM471 host target gene. LOC151195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by LOC151195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151195 BINDING SITE, designated SEQ ID:39075, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21678] Another function of VGAM471 is therefore inhibition of LOC151195 (Accession XM\_087125). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151195. LOC201952 (Accession XM\_117345) is another VGAM471 host target gene. LOC201952 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201952 BINDING SITE, designated SEQ ID:43395, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21679] Another function of VGAM471 is therefore inhibition of LOC201952 (Accession XM\_117345). Accordingly, utilities

of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201952. LOC222183 (Accession XM\_168436) is another VGAM471 host target gene. LOC222183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222183 BINDING SITE, designated SEQ ID:45186, to the nucleotide sequence of VGAM471 RNA, herein designated VGAM RNA, also designated SEQ ID:3182.

[21680] Another function of VGAM471 is therefore inhibition of LOC222183 (Accession XM\_168436). Accordingly, utilities of VGAM471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222183. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 472 (VGAM472) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21681] VGAM472 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM472 was detected is described hereinabove with reference to Figs. 1–8.

[21682] VGAM472 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick–borne Encephalitis Virus. VGAM472 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21683] VGAM472 gene encodes a VGAM472 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM472 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM472 precursor RNA is designated SEQ ID:458, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:458 is located at position 8516 relative to the genome of Tick–borne Encephalitis Virus.

[21684] VGAM472 precursor RNA folds onto itself, forming VGAM472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21685] An enzyme complex designated DICER COMPLEX, `dices` the VGAM472 folded precursor RNA into VGAM472 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM472 RNA is designated SEQ ID:3183, and is provided hereinbelow with reference to the sequence listing part.

[21686] VGAM472 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM472 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[21687] VGAM472 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM472 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM472 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21688] The complementary binding of VGAM472 RNA, herein designated VGAM RNA, to host target binding sites on VGAM472 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM472 host target RNA into VGAM472 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21689] It is appreciated that VGAM472 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM472 host target genes. The mRNA of each one of this plurality of VGAM472 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM472 RNA, herein designated VGAM RNA, and which when bound by VGAM472 RNA causes inhibition of translation of respective one or more VGAM472 host target proteins.

[21690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM472 gene, herein designated VGAM GENE, on one or more VGAM472 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21691] It is yet further appreciated that a function of VGAM472 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis Virus. Specific functions, and accordingly utilities, of VGAM472 correlate with, and may be deduced from, the identity of the host target genes which VGAM472 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21692] Nucleotide sequences of the VGAM472 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM472 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM472 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM472 are further  
described hereinbelow with reference to Table 1.

[21693] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM472 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM472 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[21694] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM472 gene, herein designated VGAM is  
inhibition of expression of VGAM472 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM472 correlate with, and may be deduced  
from, the identity of the target genes which VGAM472  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[21695] F-box Only Protein 9 (FBXO9, Accession NM\_033481) is a  
VGAM472 host target gene. FBXO9 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by FBXO9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:27260, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21696] A function of VGAM472 is therefore inhibition of F-box Only Protein 9 (FBXO9, Accession NM\_033481). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO9. FLJ14950 (Accession NM\_032865) is another VGAM472 host target gene. FLJ14950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:26674, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21697] Another function of VGAM472 is therefore inhibition of

FLJ14950 (Accession NM\_032865). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950. FLJ22362 (Accession NM\_022823) is another VGAM472 host target gene. FLJ22362 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22362 BINDING SITE, designated SEQ ID:23103, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21698] Another function of VGAM472 is therefore inhibition of FLJ22362 (Accession NM\_022823). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22362. KIAA0427 (Accession NM\_014772) is another VGAM472 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16578, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21699] Another function of VGAM472 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA0478 (Accession NM\_014870) is another VGAM472 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16981, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21700] Another function of VGAM472 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1530 (Accession XM\_042661) is another

VGAM472 host target gene. KIAA1530 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33730, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21701] Another function of VGAM472 is therefore inhibition of KIAA1530 (Accession XM\_042661). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. LOC145676 (Accession XM\_085202) is another VGAM472 host target gene. LOC145676 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145676 BINDING SITE, designated SEQ ID:37921, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21702] Another function of VGAM472 is therefore inhibition of LOC145676 (Accession XM\_085202). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145676. LOC220575 (Accession XM\_083991) is another VGAM472 host target gene. LOC220575 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220575, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220575 BINDING SITE, designated SEQ ID:37527, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21703] Another function of VGAM472 is therefore inhibition of LOC220575 (Accession XM\_083991). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220575. LOC91547 (Accession XM\_039093) is another VGAM472 host target gene. LOC91547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91547, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91547 BINDING SITE, designated SEQ ID:33002, to the nucleotide sequence of VGAM472 RNA, herein designated VGAM RNA, also designated SEQ ID:3183.

[21704] Another function of VGAM472 is therefore inhibition of LOC91547 (Accession XM\_039093). Accordingly, utilities of VGAM472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91547. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 473 (VGAM473) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21705] VGAM473 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM473 was detected is described hereinabove with reference to Figs. 1–8.

[21706] VGAM473 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne Encephalitis Virus. VGAM473 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21707] VGAM473 gene encodes a VGAM473 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM473 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM473 precursor RNA is designated SEQ ID:459, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:459 is located at position 9825 relative to the genome of Tick-borne Encephalitis Virus.

[21708] VGAM473 precursor RNA folds onto itself, forming VGAM473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21709] An enzyme complex designated DICER COMPLEX, `dices` the VGAM473 folded precursor RNA into VGAM473 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM473 RNA is designated SEQ ID:3184, and is provided hereinbelow with reference to the sequence listing part.

[21710] VGAM473 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM473 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21711] VGAM473 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM473 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM473 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21712] The complementary binding of VGAM473 RNA, herein designated VGAM RNA, to host target binding sites on VGAM473 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM473 host target RNA into VGAM473 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[21713] It is appreciated that VGAM473 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM473 host target genes. The mRNA of each one of this plurality of VGAM473 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM473 RNA, herein designated VGAM RNA, and which when bound by VGAM473 RNA causes inhibition of translation of respective one or more VGAM473 host target proteins.

[21714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM473 gene, herein designated VGAM GENE, on one or more VGAM473 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21715] It is yet further appreciated that a function of VGAM473 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM473 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis Virus. Specific functions, and accordingly utilities, of VGAM473 correlate with, and may be deduced from, the identity of the host target genes which VGAM473 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21716] Nucleotide sequences of the VGAM473 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM473 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM473 are further described hereinbelow with reference to Table 1.

[21717] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM473 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM473 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21718] As mentioned hereinabove with reference to Fig. 1, a function of VGAM473 gene, herein designated VGAM is inhibition of expression of VGAM473 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM473 correlate with, and may be deduced from, the identity of the target genes which VGAM473 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21719] Dopamine Receptor D1 (DRD1, Accession NM\_000794) is a VGAM473 host target gene. DRD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRD1 BINDING SITE, designated SEQ ID:6465, to the nucleotide sequence of VGAM473 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3184.

[21720] A function of VGAM473 is therefore inhibition of Dopamine Receptor D1 (DRD1, Accession NM\_000794), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRD1. The function of DRD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM22.Coagulation Factor II (thrombin) Receptor (F2R, Accession NM\_001992) is another VGAM473 host target gene. F2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2R BINDING SITE, designated SEQ ID:7719, to the nucleotide sequence of VGAM473 RNA, herein designated VGAM RNA, also designated SEQ ID:3184.

[21721] Another function of VGAM473 is therefore inhibition of Coagulation Factor II (thrombin) Receptor (F2R, Accession NM\_001992), a gene which Thrombin receptor; G protein-

coupled receptor involved in platelet activation. Accordingly, utilities of VGAM473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2R. The function of F2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. Angiotensin II Receptor-like 2 (AGTRL2, Accession NM\_005162) is another VGAM473 host target gene. AGTRL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AGTRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGTRL2 BINDING SITE, designated SEQ ID:11646, to the nucleotide sequence of VGAM473 RNA, herein designated VGAM RNA, also designated SEQ ID:3184.

[21722] Another function of VGAM473 is therefore inhibition of Angiotensin II Receptor-like 2 (AGTRL2, Accession NM\_005162). Accordingly, utilities of VGAM473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGTRL2. FLJ10540 (Accession NM\_018131) is another VGAM473 host target

gene. FLJ10540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10540 BINDING SITE, designated SEQ ID:19928, to the nucleotide sequence of VGAM473 RNA, herein designated VGAM RNA, also designated SEQ ID:3184.

[21723] Another function of VGAM473 is therefore inhibition of FLJ10540 (Accession NM\_018131). Accordingly, utilities of VGAM473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10540. FLJ13852 (Accession NM\_023078) is another VGAM473 host target gene. FLJ13852 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13852 BINDING SITE, designated SEQ ID:23341, to the nucleotide sequence of VGAM473 RNA, herein designated VGAM RNA, also designated SEQ ID:3184.

- [21724] Another function of VGAM473 is therefore inhibition of FLJ13852 (Accession NM\_023078). Accordingly, utilities of VGAM473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13852. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 474 (VGAM474) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [21725] VGAM474 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM474 was detected is described hereinabove with reference to Figs. 1–8.
- [21726] VGAM474 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne Encephalitis Virus. VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [21727] VGAM474 gene encodes a VGAM474 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM474 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM474 precursor RNA is designated SEQ ID:460, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:460 is located at position 7427 relative to the genome of Tick-borne Encephalitis Virus.

[21728] VGAM474 precursor RNA folds onto itself, forming VGAM474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21729] An enzyme complex designated DICER COMPLEX, `dices` the VGAM474 folded precursor RNA into VGAM474 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM474 RNA is designated SEQ ID:3185, and is provided hereinbelow with reference to the sequence listing part.

[21730] VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM474 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[21731] VGAM474 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM474 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM474 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[21732] The complementary binding of VGAM474 RNA, herein designated VGAM RNA, to host target binding sites on VGAM474 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM474 host target RNA into VGAM474 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21733] It is appreciated that VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM474 host target genes. The mRNA of each one of this plurality of VGAM474 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM474 RNA, herein designated VGAM RNA, and which when bound by VGAM474 RNA causes inhibition of translation of respective one or more VGAM474 host target proteins.

[21734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM474 gene, herein designated VGAM GENE, on one or more VGAM474 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21735] It is yet further appreciated that a function of VGAM474 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis Virus. Specific functions, and accordingly utilities, of VGAM474 correlate with, and may be deduced from, the identity of the host target genes which VGAM474 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21736] Nucleotide sequences of the VGAM474 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM474 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM474 are further described hereinbelow with reference to Table 1.

[21737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM474 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM474 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM474 gene, herein designated VGAM is inhibition of expression of VGAM474 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM474 correlate with, and may be deduced from, the identity of the target genes which VGAM474 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21739] Adducin 1 (alpha) (ADD1, Accession NM\_014190) is a VGAM474 host target gene. ADD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD1 BINDING SITE, designated SEQ ID:15471, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21740] A function of VGAM474 is therefore inhibition of Adducin 1 (alpha) (ADD1, Accession NM\_014190), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM474 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with ADD1. The function of ADD1 has been established by previous studies. Adducin is a cell-membrane skeletal protein that was first purified from human erythrocytes by Gardner and Bennett (1986) and subsequently isolated from bovine brain membranes. Isoforms of this protein have been detected in lung, kidney, testes, and liver. Erythrocyte adducin is a 200-kD heterodimer protein present at about 30,000 copies per cell. It binds with high affinity to  $\text{Ca}^{2+}$ /calmodulin and is a substrate for protein kinases A and C. Joshi and Bennett (1990) investigated the structure and function of the separate domains of the protein. Adducin is a heterodimeric protein. The related subunits, alpha and beta (ADD2; 102681), are produced from distinct genes but share a similar structure, with a protease-resistant N-terminal region and a protease-sensitive, hydrophilic C-terminal region. Joshi et al. (1991) isolated reticulocyte cDNAs for alpha- and beta-adducin and, by somatic cell hybrid analysis, provisionally assigned the ADD1 gene to chromosome 4 and the ADD2 gene to chromosome 2. Both alpha-adducin and beta-adducin show alternative splicing; thus, there may be several different heterodimeric or homodimeric forms of adducin, each

with a different functional specificity. Adducin was thought to promote assembly of spectrin-actin complexes in the formation of the membrane cytoskeleton (the name comes from the Latin adducere, meaning 'to bring together'). At least in brain, alpha-adducin is encoded by alternatively spliced mRNAs. See Gilligan and Bennett (1993) for a review of adducin and the other components of the junctional complex of the cell membrane skeleton. Casari et al. (1995) found in humans an association between essential hypertension (see OMIM Ref. No. 145500) and some allelic markers close to the alpha-adducin locus. Cusi et al. (1997) found significant linkage of the alpha-adducin locus to essential hypertension and greater sensitivity to changes in sodium balance among patients with a particular ADD1 allele, trp460 (102680.0001), suggesting that alpha-adducin is associated with a salt-sensitive form of essential hypertension. They suggested that this polymorphism may identify hypertensive patients who will benefit from diuretic treatment or maneuvers to reduce total body sodium. Heterozygous hypertensive patients (gly/trp) showed a greater fall in mean arterial pressure in response to 2 months' treatment with hydrochlorothiazide than did wildtype homozygous (gly/gly) hypertensive pa-

tients.

[21741] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21742] Joshi, R.; Gilligan, D. M.; Otto, E.; McLaughlin, T.; Bennett, V. : Primary structure and domain organization of human alpha and beta adducin. J. Cell Biol. 115: 665–675, 1991. ; and

[21743] Cusi, D.; Barlassina, C.; Azzani, T.; Casari, G.; Citterio, L.; Devoto, M.; Glorioso, N.; Lanzani, C.; Manunta, P.; Righetti, M.; Rivera, R.; Stella, P.; Troffa, C.; Zagato, L.; Bianchi.

[21744] Further studies establishing the function and utilities of ADD1 are found in John Hopkins OMIM database record ID 102680, and in cited publications numbered 791, 3622, 3784–793, 2667, 2791, 2036–79 and 482–484 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin Interacting Protein 1 (HIP1, Accession NM\_005338) is another VGAM474 host target gene. HIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIP1 BINDING SITE, designated SEQ ID:11812, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21745] Another function of VGAM474 is therefore inhibition of Huntingtin Interacting Protein 1 (HIP1, Accession NM\_005338), a gene which is a membrane protein and interacts with huntingtin. Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP1. The function of HIP1 has been established by previous studies. Huntington disease (HD; 143100) may be due to a toxic gain-of-function caused by abnormal protein-protein interactions related to the elongated polyglutamine sequence of huntingtin. Thus, the binding of distinct proteins to the polyglutamine region could either confer a new property on huntingtin or alter its normal interactions with other proteins. Wanker et al. (1997) hypothesized that the specific binding of a protein with a restricted pattern of expression to the elongated polyglutamine stretch of the huntingtin protein could cause selective vulnerability to particular cells. The potential huntingtin-interacting pro-

teins that have been identified include huntingtin-associated protein-1 (OMIM Ref. No. 600947), the glycolytic enzyme GAPD (OMIM Ref. No. 138400), and the ubiquitin-conjugating enzyme E2-25K, also named HIP2 (OMIM Ref. No. 602846), which binds selectively to the N terminus of huntingtin. Wanker et al. (1997) demonstrated the specific binding of a protein to the N terminus of huntingtin, both in the yeast 2-hybrid screen and in in vitro binding experiments. A protein region downstream of the polyglutamine stretch in huntingtin was essential for the interaction in vitro. Thus, the authors designated the new protein 'huntingtin-interacting protein-1' (HIP1). The HIP1 cDNA isolated by the 2-hybrid screen encodes a 55-kD fragment of the novel protein. Using an affinity-purified polyclonal antibody raised against recombinant HIP1, a protein of 116 kD was detected in brain extracts by Western blot analysis. The predicted amino acid sequence of the HIP1 fragment exhibited significant similarity to cytoskeleton proteins, suggesting to Wanker et al. (1997) that HIP1 and huntingtin play a functional role in the cell filament network. The HIP1 gene was found to be ubiquitously expressed at low levels in different brain regions. HIP1 is enriched in human brain but can also be detected in other

human tissues, as well as in mouse brain. The authors noted that HIP1 and huntingtin behave almost identically during subcellular fractionation and both proteins are enriched in the membrane-containing fractions. Animal model experiments lend further support to the function of HIP1. Kalchman et al. (1997) showed that HIP1 is a membrane-associated protein that colocalizes with huntingtin and shares sequence homology and biochemical characteristics with Sla2p, a protein essential for function of the cytoskeleton in *S. cerevisiae*. The huntingtin-HIP1 interaction was restricted to the brain and correlated inversely with the polyglutamine length in huntingtin. Their results provided a molecular link between huntingtin and the neuronal cytoskeleton and suggested that, in Huntington disease, loss of normal huntingtin-HIP1 interaction may contribute to a defect in membrane-cytoskeletal integrity in the brain.

[21746] It is appreciated that the abovementioned animal model for HIP1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21747] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [21748] Kalchman, M. A.; Koide, H. B.; McCutcheon, K.; Graham, R. K.; Nichol, K.; Nishiyama, K.; Kazemi-Esfarjani, P.; Lynn, F. C.; Wellington, C.; Metzler, M.; Goldberg, Y. P.; Kanazawa, I.; Gietz, R. D.; Hayden, M. R. : HIP1, a human homologue of *S. cerevisiae* Slap2, interacts with membrane-associated huntingtin in the brain. *Nature Genet.* 16: 44–53, 1997. ; and
- [21749] Wanker, E. E.; Rovira, C.; Scherzinger, E.; Hasenbank, R.; Walter, S.; Tait, D.; Colicelli, J.; Lehrach, H. : HIP-I: a huntingtin interacting protein isolated by the yeast two-hybrid sys.
- [21750] Further studies establishing the function and utilities of HIP1 are found in John Hopkins OMIM database record ID 601767, and in cited publications numbered 7175, 11274–2866, 672 and 9966 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Homeo Box C13 (HOXC13, Accession XM\_006804) is another VGAM474 host target gene. HOXC13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HOXC13 BINDING SITE, designated SEQ ID:30014, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21751] Another function of VGAM474 is therefore inhibition of Homeo Box C13 (HOXC13, Accession XM\_006804). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC13. Jerky Homolog (mouse) (JRK, Accession XM\_098818) is another VGAM474 host target gene. JRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE, designated SEQ ID:41841, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21752] Another function of VGAM474 is therefore inhibition of Jerky Homolog (mouse) (JRK, Accession XM\_098818), a gene which might function as a DNA-binding protein. Accordingly, utilities of VGAM474 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with JRK. The function of JRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210. Kelch-like 3 (*Drosophila*) (KLHL3, Accession XM\_113450) is another VGAM474 host target gene. KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42269, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21753] Another function of VGAM474 is therefore inhibition of Kelch-like 3 (*Drosophila*) (KLHL3, Accession XM\_113450). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3. Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373) is another VGAM474 host target gene. MAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA en-

coded by MAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1A BINDING SITE, designated SEQ ID:8186, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21754] Another function of VGAM474 is therefore inhibition of Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373), a gene which is a structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements. Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1A. The function of MAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. Neuralized-like (Drosophila) (NEURL, Accession NM\_004210) is another VGAM474 host target gene. NEURL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEURL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of NEURL BINDING SITE, designated SEQ ID:10415, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21755] Another function of VGAM474 is therefore inhibition of Neuralized-like (Drosophila) (NEURL, Accession NM\_004210). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEURL. Ovo-like 1(Drosophila) (OVOL1, Accession NM\_004561) is another VGAM474 host target gene. OVOL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OVOL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OVOL1 BINDING SITE, designated SEQ ID:10900, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21756] Another function of VGAM474 is therefore inhibition of Ovo-like 1(Drosophila) (OVOL1, Accession NM\_004561). Accordingly, utilities of VGAM474 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with OVOL1. UDP Glycosyltransferase 1 Family, Polypeptide A1 (UGT1A1, Accession NM\_000463) is another VGAM474 host target gene. UGT1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UGT1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UGT1A1 BINDING SITE, designated SEQ ID:6082, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21757] Another function of VGAM474 is therefore inhibition of UDP Glycosyltransferase 1 Family, Polypeptide A1 (UGT1A1, Accession NM\_000463). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGT1A1. UDP Glycosyltransferase 1 Family, Polypeptide A4 (UGT1A4, Accession NM\_007120) is another VGAM474 host target gene. UGT1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UGT1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UGT1A4 BINDING SITE, designated SEQ ID:13980, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21758] Another function of VGAM474 is therefore inhibition of UDP Glycosyltransferase 1 Family, Polypeptide A4 (UGT1A4, Accession NM\_007120), a gene which is of major importance in the conjugation and subsequent elimination of potentially toxic xenobiotics and endogenous compounds. Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGT1A4. The function of UGT1A4 has been established by previous studies. By screening a liver cDNA library with a probe to a conserved transferase C-terminal sequence, followed by 5-prime RACE, Ritter et al. (1991) obtained cDNAs encoding UGT1A1 and UGT1A4, which they termed HUGBR1 and HUGBR2, respectively. The deduced 534-amino acid UGT1A4 protein shares 66% sequence similarity with UGT1A1 in the N terminus, which contains potential N-linked glycosylation sites, and complete identity after codon 287. Northern blot analysis revealed expression of

a 2.6-kb transcript in liver. Unlike UGT1A1, expression of UGT1A4 is normal in type I Crigler–Najjar syndrome (OMIM Ref. No. 218800). Functional analysis showed that UGT1A4 has glucuronidating activity although, in a review of the UGTs, Tukey and Strassburg (2000) found that UGT1A4 activity with bilirubin is rather modest compared to that of UGT1A1. UGT1A4 is relatively active with amines, steroids, and sapogenins. By Northern blot analysis, Ritter et al. (1992) determined that UGT1A4, then termed UGT1D, is expressed at lower levels than UGT1A1 in liver. By Southern blot analysis, Ritter et al. (1992) determined that all of the UGT1A genes map to the same locus on chromosome 2.

[21759] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21760] Ritter, J. K.; Chen, F.; Sheen, Y. Y.; Tran, H. M.; Kimura, S.; Yeatman, M. T.; Owens, I. S. : A novel complex locus UGT1 encodes human bilirubin, phenol, and other UDP–glucuronosyltransferase isozymes with identical carboxyl termini. *J. Biol. Chem.* 267: 3257–3261, 1992. ; and

[21761] Tukey, R. H.; Strassburg, C. P. : Human UDP–glucuronosyltransferases: metabolism, expression, and

disease. Annu. Rev. Pharm. Toxicol. 40: 581–616, 2000.

[21762] Further studies establishing the function and utilities of UGT1A4 are found in John Hopkins OMIM database record ID 606429, and in cited publications numbered 1244 and 12449 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. UDP Glycosyltransferase 1 Family, Polypeptide A9 (UGT1A9, Accession NM\_021027) is another VGAM474 host target gene. UGT1A9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UGT1A9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UGT1A9 BINDING SITE, designated SEQ ID:22016, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21763] Another function of VGAM474 is therefore inhibition of UDP Glycosyltransferase 1 Family, Polypeptide A9 (UGT1A9, Accession NM\_021027), a gene which is of major importance in the conjugation and subsequent elimination of potentially toxic xenobiotics and endogenous compounds. Accordingly, utilities of VGAM474 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with UGT1A9. The function of UGT1A9 has been established by previous studies. By screening a liver cDNA library with a UGT1A6 (OMIM Ref. No. 606431) probe, Wooster et al. (1991) isolated a cDNA encoding UGT1A9, which they termed HLUGP4. The deduced 531-amino acid protein shares 67% overall sequence identity with UGT1A1 but only 38% in the N terminus. Western blot analysis showed expression of a 56-kD protein. Functional analysis indicated that, like UGT1A6, UGT1A9 is most active towards halogenated phenols with higher UGT1A9 activity with simple phenols. Findlay et al. (2000) reported that the predominant thyroid hormone released from the thyroid gland, T4, and the inactive rat T3 were glucuronidated by cloned expressed bilirubin UGT1A1 and also phenol UGT1A9. Results from Crigler-Najjar (see OMIM Ref. No. 218800) microsomal samples indicated that UGT1A1 was the main contributor to thyroid hormone glucuronidation in the liver, with rat T3 being the preferential substrate. In kidney microsomes, thyroid hormone glucuronidation was more complex, suggesting that more than just the UGT1A9 isoform may be involved. Bioactive T3 was not significantly glucuronidated

by these isoforms and other UGTs, and sulfotransferases may have been involved.

[21764] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21765] Wooster, R.; Sutherland, L.; Ebner, T.; Clarke, D.; Da Cruz e Silva, O.; Burchell, B. : Cloning and stable expression of a new member of the human liver phenol/bilirubin:UDP-glucuronosyltransferase cDNA family. *Biochem. J.* 278: 465–469, 1991. ; and

[21766] Findlay, K. A. B.; Kaptein, E.; Visser, T. J.; Burchell, B. : Characterization of the uridine diphosphate–glucuronosyltransferase–catalyzing thyroid hormone glucuronidation in man. *J. C.*

[21767] Further studies establishing the function and utilities of UGT1A9 are found in John Hopkins OMIM database record ID 606434, and in cited publications numbered 608 and 6081 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM\_098859) is another VGAM474 host target gene. C9orf14 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C9orf14, corre–

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf14 BINDING SITE, designated SEQ ID:41910, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21768] Another function of VGAM474 is therefore inhibition of Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM\_098859). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf14. CGI-01 (Accession NM\_015935) is another VGAM474 host target gene. CGI-01 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-01, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-01 BINDING SITE, designated SEQ ID:18056, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21769] Another function of VGAM474 is therefore inhibition of CGI-01 (Accession NM\_015935). Accordingly, utilities of

VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-01. DKFZp434C0923 (Accession NM\_017598) is another VGAM474 host target gene. DKFZp434C0923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434C0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0923 BINDING SITE, designated SEQ ID:19063, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21770] Another function of VGAM474 is therefore inhibition of DKFZp434C0923 (Accession NM\_017598). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0923. DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM\_028966) is another VGAM474 host target gene. DNAJC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC5 BINDING SITE, designated SEQ ID:30811, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21771] Another function of VGAM474 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM\_028966). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC5. FLJ23584 (Accession NM\_024588) is another VGAM474 host target gene. FLJ23584 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23584 BINDING SITE, designated SEQ ID:23822, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21772] Another function of VGAM474 is therefore inhibition of FLJ23584 (Accession NM\_024588). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ23584. HYA22 (Accession NM\_005808) is another VGAM474 host target gene. HYA22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYA22 BINDING SITE, designated SEQ ID:12389, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21773] Another function of VGAM474 is therefore inhibition of HYA22 (Accession NM\_005808). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYA22. KIAA0237 (Accession NM\_014747) is another VGAM474 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16443, to the nucleotide sequence of

VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21774] Another function of VGAM474 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA1546 (Accession XM\_042301) is another VGAM474 host target gene. KIAA1546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1546 BINDING SITE, designated SEQ ID:33717, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21775] Another function of VGAM474 is therefore inhibition of KIAA1546 (Accession XM\_042301). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1546. LBP-9 (Accession NM\_014553) is another VGAM474 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15881, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21776] Another function of VGAM474 is therefore inhibition of LBP-9 (Accession NM\_014553). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. Ninjurin 2 (NINJ2, Accession NM\_016533) is another VGAM474 host target gene. NINJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NINJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NINJ2 BINDING SITE, designated SEQ ID:18602, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21777] Another function of VGAM474 is therefore inhibition of Ninjurin 2 (NINJ2, Accession NM\_016533). Accordingly,

utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NINJ2. PDZ Domain Containing 2 (PDZD2, Accession XM\_087705) is another VGAM474 host target gene.

PDZD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39396, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21778] Another function of VGAM474 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM\_087705). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. PKMYT1 (Accession NM\_004203) is another VGAM474 host target gene. PKMYT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PKMYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PKMYT1 BINDING SITE, designated SEQ ID:10398, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21779] Another function of VGAM474 is therefore inhibition of PKMYT1 (Accession NM\_004203). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKMYT1. Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM\_117531) is another VGAM474 host target gene. PRKWNK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKWNK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:43520, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21780] Another function of VGAM474 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM\_117531). Accordingly, utilities of VGAM474 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWINK2. Sideroflexin 2 (SFXN2, Accession XM\_058359) is another VGAM474 host target gene. SFXN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN2 BINDING SITE, designated SEQ ID:36602, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21781] Another function of VGAM474 is therefore inhibition of Sideroflexin 2 (SFXN2, Accession XM\_058359). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN2. Syntaphilin (SNPH, Accession NM\_014723) is another VGAM474 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SNPH BINDING SITE, designated SEQ ID:16292, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21782] Another function of VGAM474 is therefore inhibition of Syntaphilin (SNPH, Accession NM\_014723). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. LOC147599 (Accession XM\_097253) is another VGAM474 host target gene. LOC147599 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147599 BINDING SITE, designated SEQ ID:40848, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21783] Another function of VGAM474 is therefore inhibition of LOC147599 (Accession XM\_097253). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147599. LOC150383 (Accession XM\_086905) is another VGAM474 host target gene. LOC150383 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150383 BINDING SITE, designated SEQ ID:38947, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21784] Another function of VGAM474 is therefore inhibition of LOC150383 (Accession XM\_086905). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150383. LOC151836 (Accession XM\_098124) is another VGAM474 host target gene. LOC151836 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151836 BINDING SITE, designated SEQ ID:41391, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21785] Another function of VGAM474 is therefore inhibition of

LOC151836 (Accession XM\_098124). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151836. LOC221421 (Accession XM\_166428) is another VGAM474 host target gene. LOC221421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221421 BINDING SITE, designated SEQ ID:44325, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21786] Another function of VGAM474 is therefore inhibition of LOC221421 (Accession XM\_166428). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221421. LOC255196 (Accession XM\_173157) is another VGAM474 host target gene. LOC255196 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:46415, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21787] Another function of VGAM474 is therefore inhibition of LOC255196 (Accession XM\_173157). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196. LOC256337 (Accession XM\_170643) is another VGAM474 host target gene. LOC256337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256337 BINDING SITE, designated SEQ ID:45422, to the nucleotide sequence of VGAM474 RNA, herein designated VGAM RNA, also designated SEQ ID:3185.

[21788] Another function of VGAM474 is therefore inhibition of LOC256337 (Accession XM\_170643). Accordingly, utilities of VGAM474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256337. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 475 (VGAM475) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21789] VGAM475 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM475 was detected is described hereinabove with reference to Figs. 1–8.

[21790] VGAM475 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne Encephalitis Virus. VGAM475 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21791] VGAM475 gene encodes a VGAM475 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM475 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM475 precursor RNA is designated SEQ ID:461, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:461 is

located at position 606 relative to the genome of Tick-borne Encephalitis Virus.

[21792] VGAM475 precursor RNA folds onto itself, forming VGAM475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21793] An enzyme complex designated DICER COMPLEX, `dices` the VGAM475 folded precursor RNA into VGAM475 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM475 RNA is designated SEQ ID:3186, and is provided hereinbelow with reference to the sequence listing part.

[21794] VGAM475 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM475 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[21795] VGAM475 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM475 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM475 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM475 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[21796] The complementary binding of VGAM475 RNA, herein designated VGAM RNA, to host target binding sites on VGAM475 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM475 host target RNA into VGAM475 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21797] It is appreciated that VGAM475 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM475 host target genes. The mRNA of each one of this plurality of VGAM475 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM475 RNA, herein designated VGAM RNA, and which when bound by VGAM475 RNA causes inhibition of translation of respective one or more VGAM475

host target proteins.

[21798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM475 gene, herein designated VGAM GENE, on one or more VGAM475 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21799] It is yet further appreciated that a function of VGAM475 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis

Virus. Specific functions, and accordingly utilities, of VGAM475 correlate with, and may be deduced from, the identity of the host target genes which VGAM475 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21800] Nucleotide sequences of the VGAM475 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM475 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM475 are further described hereinbelow with reference to Table 1.

[21801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM475 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM475 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[21802] As mentioned hereinabove with reference to Fig. 1, a function of VGAM475 gene, herein designated VGAM is inhibition of expression of VGAM475 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM475 correlate with, and may be deduced from, the identity of the target genes which VGAM475 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21803] Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963) is a VGAM475 host target gene. ARHGEF6 BINDING SITE1 and ARHGEF6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGEF6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF6 BINDING SITE1 and ARHGEF6 BINDING SITE2, designated SEQ ID:33843 and SEQ ID:33850 respectively, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21804] A function of VGAM475 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. Calbindin 1, 28kDa (CALB1, Accession NM\_004929) is another VGAM475 host target gene.

CALB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALB1 BINDING SITE, designated SEQ ID:11370, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21805] Another function of VGAM475 is therefore inhibition of Calbindin 1, 28kDa (CALB1, Accession NM\_004929), a gene which buffers cytosolic calcium. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALB1. The function of CALB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM266. E2F Transcription Factor 3 (E2F3, Accession NM\_001949) is another VGAM475 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:7666, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21806] Another function of VGAM475 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM\_001949), a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F3. The function of E2F3 has been established by previous studies. MYC (OMIM Ref. No. 190080) induces transcription of the E2F1, E2F2 (OMIM Ref. No. 600426), and E2F3 genes. Using primary mouse embryo fibroblasts deleted for individual E2f genes, Leone et al. (2001) showed that MYC-induced S phase and apoptosis requires distinct E2F activities. The ability of Myc to induce S phase was impaired in the absence of either E2f2 or E2f3 but not E2f1 or E2f4 (OMIM Ref. No. 600659). In contrast, the ability of Myc to induce apoptosis was markedly reduced in cells deleted for E2f1 but not E2f2 or E2f3. The authors proposed that the induction of specific E2F activities is an essential component in the MYC pathways that control cell proliferation

and cell fate decisions. Animal model experiments lend further support to the function of E2F3. Cloud et al. (2002) generated E2f3-null mice. They found that E2f3 was essential for embryonic viability in the pure 129/Sv background, but that the presence of C57BL/6 alleles yielded some adult survivors. Although growth retarded, surviving E2f3 -/- animals were initially healthy and exhibited no obvious tumor phenotype. They died prematurely, however, with signs typical of congestive heart failure, a defect completely distinct from those reported in E2f1-null mice. Cloud et al. (2002) also generated E2f1/E2f3 compound mutant mice and found that almost all of the developmental and age-related defects arising in the individual E2f1- or E2f3-null mice were exacerbated by the mutation of the other E2f. One major difference in the properties of E2f1 and E2f3 loss was that, either alone or in combination with loss of E2f1, E2f3 mutants did not show an increase in the incidence of tumor formation.

[21807] It is appreciated that the abovementioned animal model for E2F3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21808] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[21809] Leone, G.; Sears, R.; Huang, E.; Rempel, R.; Nuckolls, F.; Park, C.-H.; Giangrande, P.; Wu, L.; Saavedra, H. I.; Field, S. J.; Thompson, M. A.; Yang, H.; Fujiwara, Y.; Greenberg, M. E.; Orkin, S.; Smith, C.; Nevins, J. R. : Myc requires distinct E2F activities to induce S phase and apoptosis. Molec. Cell 8: 105–113, 2001. ; and

[21810] Cloud, J. E.; Rogers, C.; Reza, T. L.; Ziebold, U.; Stone, J. R.; Picard, M. H.; Caron, A. M.; Bronson, R. T.; Lees, J. A. : Mutant mouse models reveal the relative roles of E2F1 and E2.

[21811] Further studies establishing the function and utilities of E2F3 are found in John Hopkins OMIM database record ID 600427, and in cited publications numbered 7563–7564, 756 and 9711 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM\_022051) is another VGAM475 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22580, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21812] Another function of VGAM475 is therefore inhibition of Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM\_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216. Huntingtin Interacting Protein 1 (HIP1, Accession NM\_005338) is another VGAM475 host target gene. HIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIP1 BINDING SITE, designated SEQ ID:11813, to the nucleotide sequence of VGAM475 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3186.

[21813] Another function of VGAM475 is therefore inhibition of Huntingtin Interacting Protein 1 (HIP1, Accession NM\_005338), a gene which is a membrane protein and interacts with huntingtin. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP1. The function of HIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM474. Holocarboxylase Synthetase (biotin-[propionyl-Coenzyme A-carboxylase (ATP-hydrolysing)] Ligase) (HLCS, Accession NM\_000411) is another VGAM475 host target gene. HLCS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HLCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLCS BINDING SITE, designated SEQ ID:5993, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21814] Another function of VGAM475 is therefore inhibition of

## Holocarboxylase Synthetase

(biotin-[propionyl-Coenzyme A-carboxylase

(ATP-hydrolysing)] Ligase) (HLCS, Accession NM\_000411).

Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLCS. Interleukin 1, Alpha (IL1A, Accession XM\_031221) is another VGAM475 host target gene. IL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1A BINDING SITE, designated SEQ ID:31306, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21815] Another function of VGAM475 is therefore inhibition of Interleukin 1, Alpha (IL1A, Accession XM\_031221), a gene which stimulates thymocyte proliferation by inducing il-2 release, b-cell maturation & proliferation, & fibroblast growth factor activity. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1A. The function of IL1A has been established by previous studies. There

are 2 structurally distinct forms of IL1: IL1(alpha), which is the acidic form with pI5, and IL1(beta) (IL1B; 147720), the neutral form with pI7. Both are 17-kD proteins coded by separate genes. The IL1A gene has 10,206 bp with 7 exons and 6 introns (Furutani et al., 1986). By Southern transfer analysis of DNAs from human-rodent somatic cell hybrids, Modi et al. (1988) assigned the IL1A gene to chromosome 2. Regional localization to 2q13-q21 was achieved by in situ hybridization. Lafage et al. (1989) confirmed assignment to 2q13 by in situ hybridization. The IL1A and IL1B proteins, which are synthesized by a variety of cell types including activated macrophages, keratinocytes, stimulated B lymphocytes, and fibroblasts, are potent mediators of inflammation and immunity. Lord et al. (1991) demonstrated that both the alpha and beta forms, but particularly the beta form, are transcribed in polymorphonuclear leukocytes stimulated with LPS. Both IL1A and IL1B stimulate osteoclast activity in vitro and are potent bone resorbing factors. Sabatino et al. (1988) studied the effects of 72-hour subcutaneous infusions of interleukins 1-alpha and -beta on plasma, calcium, and bone morphology. Both interleukins 1 caused a marked, dose-dependent increase in plasma calcium. Increased

numbers of osteoclasts and bone resorption surfaces were observed on quantitative histomorphometry of bone. The results suggest a role for IL1 in the modulation of extracellular fluid calcium homeostasis. Hogquist et al. (1991) demonstrated that interleukin-1 is involved in apoptosis (cell death). Both the alpha and the beta forms are released as a consequence of cell injury regardless of the insult Ki et al. (2001) analyzed the IL1A -889 C/T genotype of 126 Korean patients with AD and found no significant difference in allele frequencies between patients and controls. Interestingly, there were no T/T homozygotes in the entire study population

[21816] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21817] Hogquist, K. A.; Nett, M. A.; Unanue, E. R.; Chaplin, D. D. : Interleukin 1 is processed and released during apoptosis. Proc. Nat. Acad. Sci. 88: 8485-8489, 1991. ; and

[21818] Ki, C.-S.; Na, D. L.; Kim, D. K.; Kim, H. J.; Kim, J.-W. : Lack of association of the interleukin-1-alpha gene polymorphism with Alzheimer's disease in a Korean population. (Letter) Ann.

[21819] Further studies establishing the function and utilities of

IL1A are found in John Hopkins OMIM database record ID 147760, and in cited publications numbered 4142–4157, 4139–4141, 4158, 1116 and 11331–11334 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 1 (MAP3K7IP1, Accession NM\_006116) is another VGAM475 host target gene. MAP3K7IP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K7IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP1 BINDING SITE, designated SEQ ID:12763, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21820] Another function of VGAM475 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 1 (MAP3K7IP1, Accession NM\_006116), a gene which may be an important signaling intermediate between tgfb receptors and map3k7/tak1. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with MAP3K7IP1. The function of MAP3K7IP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM132. Microtubule-associated Protein Tau (MAPT, Accession NM\_005910) is another VGAM475 host target gene. MAPT BINDING SITE1 through MAPT BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPT BINDING SITE1 through MAPT BINDING SITE4, designated SEQ ID:12542, SEQ ID:18830, SEQ ID:18836 and SEQ ID:18842 respectively, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21821] Another function of VGAM475 is therefore inhibition of Microtubule-associated Protein Tau (MAPT, Accession NM\_005910), a gene which Microtubule-associated protein tau; promotes microtubule assembly. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with MAPT. The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM\_006235) is another VGAM475 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12894, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21822] Another function of VGAM475 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM\_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM171.PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_012231) is another VGAM475 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:14530, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21823] Another function of VGAM475 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Secreted Frizzled-related Protein 1 (SFRP1,

Accession NM\_003012) is another VGAM475 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8932, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21824] Another function of VGAM475 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. Serine Hydroxymethyltransferase 1 (soluble) (SHMT1, Accession NM\_004169) is another VGAM475 host target gene. SHMT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SHMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHMT1 BINDING SITE, designated SEQ ID:10375, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21825] Another function of VGAM475 is therefore inhibition of Serine Hydroxymethyltransferase 1 (soluble) (SHMT1, Accession NM\_004169), a gene which interconverts serine and glycine. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHMT1. The function of SHMT1 has been established by previous studies. Serine hydroxymethyltransferase (SHMT), a pyridoxal phosphate-containing enzyme, catalyzes the reversible conversion of serine and tetrahydrofolate to glycine and 5,10-methylene tetrahydrofolate. Some eukaryotic cells, including human cells, contain both cytosolic and mitochondrial forms of SHMT. Mammalian cells that lack mitochondrial SHMT activity are auxotrophic for glycine (SHMT2; 138450). It has been suggested that glycine synthesis from serine occurs in the mitochondria, whereas cytosolic SHMT may catalyze

the conversion of glycine to serine, although direct evidence for this proposal is lacking. Garrow et al. (1993) cloned human cDNAs for cytosolic and mitochondrial SHMT by functional complementation of an *Escherichia coli* glyA mutant with a human cDNA library. The cDNA for the cytosolic enzyme encoded a 483-residue protein of M(r) 53,020. The deduced protein sequence shared 63% identity with that of the SHMT2 protein. By isotopic in situ hybridization, Garrow et al. (1993) assigned the cytosolic and mitochondrial SHMT genes to 17p11.2 and 12q13, respectively. The high degree of nucleotide sequence identity between the 2 isozymes as well as the presence of keratin genes in both chromosomal regions was consistent with these regions of chromosomes 12 and 17 having arisen by a duplication event. Folate-dependent one-carbon metabolism is critical for the synthesis of numerous cellular constituents required for cell growth, and SHMT is central to this process. Elsea et al. (1995) found that the SHMT1 gene maps to the critical interval for Smith-Magenis syndrome (SMS; 182290) on 17p11.2. They found that the gene spans approximately 40 kb. It was found to be deleted in all 26 SMS patients examined by PCR, fluorescence in situ hybridization, and/or South-

ern analysis. Furthermore, haploinsufficiency was indicated by the fact that SHMT enzyme activity in patient lymphoblasts was approximately 50% that of unaffected parent lymphoblasts. They suggested that haploinsufficiency may play a role in the SMS phenotype and that this finding may point to possible therapeutic interventions.

[21826] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21827] Garrow, T. A.; Brenner, A. A.; Whitehead, V. M.; Chen, X.-N.; Duncan, R. G.; Korenberg, J. R.; Shane, B. : Cloning of human cDNAs encoding mitochondrial and cytosolic serine hydroxymethyltransferases and chromosomal localization. J. Biol. Chem. 268: 11910–11916, 1993. ; and

[21828] Elsea, S. H.; Juyal, R. C.; Jiralerspong, S.; Finucane, B. M.; Pandolfo, M.; Greenberg, F.; Baldini, A.; Stover, P.; Patel, P. I. : Haploinsufficiency of cytosolic serine hydroxymethyltran.

[21829] Further studies establishing the function and utilities of SHMT1 are found in John Hopkins OMIM database record ID 182144, and in cited publications numbered 1142–114 and 4810 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Sorbin

and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385) is another VGAM475 host target gene. SORBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:17690, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21830] Another function of VGAM475 is therefore inhibition of Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385), a gene which necessary for cell polarization during vegetative growth. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORBS1. The function of SORBS1 has been established by previous studies. Lin et al. (2001) identified 14 single-nucleotide polymorphisms (SNPs) in the human SH3P12 gene, which they called SORBS1. Studies in 202 nonobese, 113 obese, and 455 subjects with type II diabetes (OMIM Ref. No. 125853) revealed that the alanine allele of a T228A poly-

morphism in exon 7 exerted a protective role for both obesity (OMIM Ref. No. 601665) (relative risk 0.466; 95% confidence interval 0.265 to 0.821) and diabetes (relative risk 0.668; 95% confidence interval 0.472 to 0.945). Neither allele of the R74W polymorphism was associated with either obesity or diabetes. The authors suggested that the SH3P12 gene may play an important role in the pathogenesis of human disorders with insulin resistance. Insulin stimulates the transport of glucose into fat and muscle cells and initiates its actions by binding to its tyrosine kinase receptor, leading to the phosphorylation of intracellular substrates. One such substrate is the CBL protooncogene product. CBL is recruited to the insulin receptor by interaction with the adaptor protein CAP, through 1 of 3 adjacent SH3 domains in the C terminus of CAP. Upon phosphorylation of CBL, the CAP-CBL complex dissociates from the insulin receptor and moves to a caveolin (see OMIM Ref. No. 601047)-enriched triton-insoluble membrane fraction (Mastick et al., 1995). To identify a molecular mechanism underlying this subcellular redistribution, Baumann et al. (2000) screened a yeast 2-hybrid library using the N-terminal region of CAP and identified the caveolar protein flotillin (OMIM Ref. No. 131560). Flotillin

forms a ternary complex with CAP and CBL, directing the localization of the CAP–CBL complex to a lipid raft subdomain of the plasma membrane. Expression of the N-terminal domain of CAP in 3T3–L1 adipocytes blocks the stimulation of glucose transport by insulin, without affecting signaling events that depend on phosphatidylinositol–3–OH kinase (see OMIM Ref. No. 602838). Thus, localization of the CBL–CAP complex to lipid rafts generates a pathway that is crucial in the regulation of glucose uptake.

[21831] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21832] Lin, W.–H.; Chiu, K. C.; Chang, H.–M.; Lee, K.–C.; Tai, T.–Y.; Chuang, L.–M. : Molecular scanning of the human sorbin and SH3–domain–containing–1 (SORBS1) gene: positive association of the T228A polymorphism with obesity and type 2 diabetes. *Hum. Molec. Genet.* 10: 1753–1760, 2001. ; and

[21833] Baumann, C. A.; Ribon, V.; Kanzaki, M.; Thurmond, D. C.; Mora, S.; Shigematsu, S.; Bickel, P. E.; Pessin, J. E.; Saltiel, A. R. : CAP defines a second signalling pathway required for insulin.

[21834] Further studies establishing the function and utilities of SORBS1 are found in John Hopkins OMIM database record ID 605264, and in cited publications numbered 4598, 11935–5034, 1090 and 11936 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. **Sepiapterin Reductase** (7,8–dihydrobiopterin:NADP+ oxidoreductase) (SPR, Accession NM\_003124) is another VGAM475 host target gene. SPR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPR BINDING SITE, designated SEQ ID:9094, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21835] Another function of VGAM475 is therefore inhibition of Sepiapterin Reductase (7,8–dihydrobiopterin:NADP+ oxidoreductase) (SPR, Accession NM\_003124), a gene which catalyzes the. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPR. The function of SPR has been established by previous studies. Bonafe et al.

(2001) reported 2 patients with progressive psychomotor retardation, dystonia, severe dopamine and serotonin deficiencies (low levels of 5-hydroxyindoleacetic and homovanillic acids), and abnormal pterin pattern (high levels of biopterin and dihydrobiopterin) in cerebrospinal fluid. They presented with normal urinary pterins and without hyperphenylalaninemia. Studies of skin fibroblasts revealed inactive sepiapterin reductase, the enzyme catalyzing the final 2-step reaction in the biosynthesis of tetrahydrobiopterin (BH4). Mutations in the SPR gene were detected in both patients: homozygous (182125.0001) in 1 and compound heterozygous (182125.0002) in the other. The authors suggested that autosomal recessive deficiency of sepiapterin reductase leads to BH4 and neurotransmitter deficiencies without hyperphenylalaninemia and may not be detected by neonatal screening for phenylketonuria.

[21836] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21837] Bonafe, L.; Thony, B.; Penzien, J. M.; Czarnecki, B.; Blau, N. : Mutations in the sepiapterin reductase gene cause a novel tetrahydrobiopterin-dependent monoamine-

neurotransmitter deficiency without hyperphenylalaninemia. Am. J. Hum. Genet. 69: 269–277, 2001. ; and

[21838] Blau, N.; Thony, B.; Renneberg, A.; Arnold, L. A.; Hyland, K. : Dihydropteridine reductase deficiency localized to the central nervous system. J. Inherit. Metab. Dis. 21: 433–434, 1998.

[21839] Further studies establishing the function and utilities of SPR are found in John Hopkins OMIM database record ID 182125, and in cited publications numbered 10607–10612 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Topoisomerase (DNA) I (TOP1, Accession NM\_003286) is another VGAM475 host target gene. TOP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOP1 BINDING SITE, designated SEQ ID:9296, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21840] Another function of VGAM475 is therefore inhibition of Topoisomerase (DNA) I (TOP1, Accession NM\_003286).

Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOP1. Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445) is another VGAM475 host target gene. TPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPK1 BINDING SITE, designated SEQ ID:22779, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21841] Another function of VGAM475 is therefore inhibition of Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445), a gene which catalyzes the conversion of thiamine, a form of vitamin B1, to thiamine pyrophosphate . Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPK1. The function of TPK1 has been established by previous studies. By Northern blot analysis, Nosaka et al. (1999) detected expression of mouse Tpk1 predominantly in kidney and liver, with very

faint expression in heart, brain, and testis. In contrast to the tissue-specific expression of mouse Tpk1, Nosaka et al. (2001) reported broad expression of a human 2.5-kb TPK1 transcript. They detected very low expression in a variety of human tissues and relatively abundant expression in heart, kidney, and peripheral leukocytes. By Northern blot analysis, Zhao et al. (2001) detected broad expression of a 2.6-kb TPK1 transcript, with highest levels in testis and in those tissues involved in thiamine absorption (small intestine) and reabsorption (OMIM Ref. No. kidney). They also detected a smaller (1–1.5 kb), testis-specific TPK1 transcript. From results of cell culture experiments, Nosaka et al. (1999) and Nosaka et al. (2001) concluded that thiamine or a thiamine derivative does not participate in the regulation of TPK1. Nosaka et al. (2001) detected no difference in TPK1 expression in cultured fibroblasts from normal subjects or from patients with thiamine-responsive megaloblastic anemia (OMIM Ref. No. 249270).

[21842] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21843] Zhao, R.; Gao, F.; Goldman, I. D. : Molecular cloning of

human thiamin pyrophosphokinase. Biochim. Biophys.

Acta 1517: 320–322, 2001. ; and

[21844] Nosaka, K.; Onozuka, M.; Nishino, H.; Nishimura, H.; Kawasaki, Y.; Ueyama, H. : Molecular cloning and expression of a mouse thiamin pyrophosphokinase cDNA. J. Biol. Chem. 274: 34129–3413.

[21845] Further studies establishing the function and utilities of TPK1 are found in John Hopkins OMIM database record ID 606370, and in cited publications numbered 6176–6178 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wolf–Hirschhorn Syndrome Candidate 1–like 1 (WHSC1L1, Accession NM\_017778) is another VGAM475 host target gene. WHSC1L1 BINDING SITE1 and WHSC1L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1L1 BINDING SITE1 and WHSC1L1 BINDING SITE2, designated SEQ ID:19409 and SEQ ID:23316 respectively, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21846] Another function of VGAM475 is therefore inhibition of Wolf–Hirschhorn Syndrome Candidate 1–like 1 (WHSC1L1, Accession NM\_017778), a gene which restores repair of base–base and single– nucleotide insertion–deletion mismatches, and increases the proficiency to process heteroduplexes with insertion–deletion mismatches. Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1L1. The function of WHSC1L1 has been established by previous studies. By EST database searching with mouse Nsd1 (OMIM Ref. No. 606681) and human NSD2 (WHSC1; 602952) as probe and screening of an amnion cell cDNA library, Angrand et al. (2001) cloned a partial sequence for WHSC1L1, which they called NSD3. They obtained the full–length cDNA by 5–prime RACE. The deduced 1,437–amino acid protein contains 2 PWWP domains involved in protein–protein interaction, 5 PHD–type zinc finger motifs found in chromatin–associated proteins, a SAC (SET–associated cys–rich) domain, a SET domain, and a C–terminal C5HCH domain. They also identified a variant, arising from alternative polyadenylation and exon splicing, that encodes a deduced 645–amino acid peptide. The short isoform contains a single PWWP domain. By PCR

analysis, Angrand et al. (2001) found the 2 variants, as well as a third, 1,388–amino acid peptide, in HeLa cells. WHSC1L1 shares 68% and 55% identity with mouse Nsd1 (OMIM Ref. No. 606681) and human WHSC1 (OMIM Ref. No. 602952), respectively, over a 700–amino acid block containing the SAC, SET, and C5HCH domains. Northern blot analysis detected an 8.5–kb transcript in all tissues examined, with highest expression in brain, heart, and skeletal muscle, and lower expression in liver and lung. Angrand et al. (2001) determined that the WHSC1L1 gene contains 24 exons and spans over 90 kb. By FISH, Angrand et al. (2001) mapped the WHSC1L1 gene to chromosome 8p12. Stec et al. (2001) identified a pseudogene (WHSC1L2P) on chromosome 17q21. Rosati et al. (2002) described fusion between the NUP98 gene (OMIM Ref. No. 601021) and the NSD3 gene in a patient with acute myeloid leukemia associated with t(8;11)(p11.2;p15). FISH analysis revealed a split of a specific BAC which showed the fusion partner at 8p11.2 to be NSD3.

[21847] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21848] Angrand, P.–O.; Apiou, F.; Stewart, A. F.; Dutrillaux, B.;

Losson, R.; Chambon, P. : NSD3, a new SET domain-containing gene, maps to 8p12 and is amplified in human breast cancer cell lines. Genomics 74: 79–88, 2001. ; and

[21849] Rosati, R.; La Starza, R.; Veronese, A.; Aventin, A.; Schwienbacher, C.; Vallespi, T.; Negrini, M.; Martelli, M. F.; Mecucci, C. : NUP98 is fused to the NSD3 gene in acute myeloid leuke.

[21850] Further studies establishing the function and utilities of WHSC1L1 are found in John Hopkins OMIM database record ID 607083, and in cited publications numbered 549 and 9652 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 4 (C20orf4, Accession NM\_015511) is another VGAM475 host target gene. C20orf4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf4 BINDING SITE, designated SEQ ID:17772, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21851] Another function of VGAM475 is therefore inhibition of Chromosome 20 Open Reading Frame 4 (C20orf4, Accession NM\_015511). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf4. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549) is another VGAM475 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13309, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21852] Another function of VGAM475 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. CTAGE-1 (Accession NM\_022663) is another VGAM475 host target gene. CTAGE-1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTAGE-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTAGE-1 BINDING SITE, designated SEQ ID:22910, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21853] Another function of VGAM475 is therefore inhibition of CTAGE-1 (Accession NM\_022663). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTAGE-1. F-box Only Protein 9 (FBXO9, Accession NM\_033480) is another VGAM475 host target gene. FBXO9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:27255, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21854] Another function of VGAM475 is therefore inhibition of F-

box Only Protein 9 (FBXO9, Accession NM\_033480). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO9. FLJ13322 (Accession NM\_024722) is another VGAM475 host target gene. FLJ13322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13322 BINDING SITE, designated SEQ ID:24061, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21855] Another function of VGAM475 is therefore inhibition of FLJ13322 (Accession NM\_024722). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13322. FLJ13646 (Accession NM\_024584) is another VGAM475 host target gene. FLJ13646 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ13646 BINDING SITE, designated SEQ ID:23815, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21856] Another function of VGAM475 is therefore inhibition of FLJ13646 (Accession NM\_024584). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13646. FLJ20188 (Accession NM\_017703) is another VGAM475 host target gene. FLJ20188 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20188 BINDING SITE, designated SEQ ID:19277, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21857] Another function of VGAM475 is therefore inhibition of FLJ20188 (Accession NM\_017703). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20188. FLJ21032 (Accession NM\_024906) is another VGAM475

host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24403, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21858] Another function of VGAM475 is therefore inhibition of FLJ21032 (Accession NM\_024906). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. FLJ23306 (Accession NM\_024530) is another VGAM475 host target gene. FLJ23306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23306 BINDING SITE, designated SEQ ID:23733, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21859] Another function of VGAM475 is therefore inhibition of FLJ23306 (Accession NM\_024530). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23306. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM\_024513) is another VGAM475 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23716, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21860] Another function of VGAM475 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM\_024513). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. GMPPB (Accession XM\_171044) is another VGAM475 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45816, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21861] Another function of VGAM475 is therefore inhibition of GMPPB (Accession XM\_171044). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. HCC-4 (Accession NM\_138611) is another VGAM475 host target gene. HCC-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCC-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCC-4 BINDING SITE, designated SEQ ID:28897, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21862] Another function of VGAM475 is therefore inhibition of HCC-4 (Accession NM\_138611). Accordingly, utilities of

VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCC-4. HM74 (Accession NM\_006018) is another VGAM475 host target gene. HM74 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HM74, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HM74 BINDING SITE, designated SEQ ID:12637, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21863] Another function of VGAM475 is therefore inhibition of HM74 (Accession NM\_006018). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HM74. HSPC063 (Accession NM\_014155) is another VGAM475 host target gene. HSPC063 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPC063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC063 BINDING SITE,

designated SEQ ID:15438, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21864] Another function of VGAM475 is therefore inhibition of HSPC063 (Accession NM\_014155). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC063. KIAA0247 (Accession NM\_014734) is another VGAM475 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16372, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21865] Another function of VGAM475 is therefore inhibition of KIAA0247 (Accession NM\_014734). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0668 (Accession XM\_039332) is another VGAM475 host target gene. KIAA0668 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0668 BINDING SITE, designated SEQ ID:33049, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21866] Another function of VGAM475 is therefore inhibition of KIAA0668 (Accession XM\_039332). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0668. KIAA0669 (Accession NM\_014779) is another VGAM475 host target gene. KIAA0669 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0669 BINDING SITE, designated SEQ ID:16628, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21867] Another function of VGAM475 is therefore inhibition of

KIAA0669 (Accession NM\_014779). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0669. KIAA0710 (Accession NM\_014871) is another VGAM475 host target gene. KIAA0710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0710 BINDING SITE, designated SEQ ID:16994, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21868] Another function of VGAM475 is therefore inhibition of KIAA0710 (Accession NM\_014871). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0710. KIAA0720 (Accession XM\_030970) is another VGAM475 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31237, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21869] Another function of VGAM475 is therefore inhibition of KIAA0720 (Accession XM\_030970). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0720. KIAA1045 (Accession XM\_048592) is another VGAM475 host target gene. KIAA1045 BINDING SITE1 and KIAA1045 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1045, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE1 and KIAA1045 BINDING SITE2, designated SEQ ID:35203 and SEQ ID:35204 respectively, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21870] Another function of VGAM475 is therefore inhibition of KIAA1045 (Accession XM\_048592). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1045. KIAA1337 (Accession XM\_052561) is another VGAM475 host target gene. KIAA1337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1337 BINDING SITE, designated SEQ ID:35982, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21871] Another function of VGAM475 is therefore inhibition of KIAA1337 (Accession XM\_052561). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1337. KIAA1393 (Accession XM\_050793) is another VGAM475 host target gene. KIAA1393 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35683, to the

nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21872] Another function of VGAM475 is therefore inhibition of KIAA1393 (Accession XM\_050793). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. KIAA1854 (Accession XM\_049884) is another VGAM475 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35532, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21873] Another function of VGAM475 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. KIAA1889 (Accession XM\_056298) is another VGAM475 host target gene. KIAA1889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1889 BINDING SITE, designated SEQ ID:36385, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21874] Another function of VGAM475 is therefore inhibition of KIAA1889 (Accession XM\_056298). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1889. Lysophospholipase II (LYPLA2, Accession NM\_007260) is another VGAM475 host target gene. LY-PLA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LYPLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYPLA2 BINDING SITE, designated SEQ ID:14130, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21875] Another function of VGAM475 is therefore inhibition of

Lysophospholipase II (LYPLA2, Accession NM\_007260). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYPLA2. Mab-21-like 2 (*C. elegans*) (MAB21L2, Accession NM\_006439) is another VGAM475 host target gene. MAB21L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAB21L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L2 BINDING SITE, designated SEQ ID:13153, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21876] Another function of VGAM475 is therefore inhibition of Mab-21-like 2 (*C. elegans*) (MAB21L2, Accession NM\_006439). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L2. MGC2654 (Accession NM\_024109) is another VGAM475 host target gene. MGC2654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2654, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2654 BINDING SITE, designated SEQ ID:23555, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21877] Another function of VGAM475 is therefore inhibition of MGC2654 (Accession NM\_024109). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2654. Prostate Cancer Associated Protein 7 (PCANAP7, Accession XM\_167803) is another VGAM475 host target gene. PCANAP7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCANAP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCANAP7 BINDING SITE, designated SEQ ID:44839, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21878] Another function of VGAM475 is therefore inhibition of Prostate Cancer Associated Protein 7 (PCANAP7, Accession

XM\_167803). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCANAP7. Phosphatidylserine Synthase 2 (PTDSS2, Accession NM\_030783) is another VGAM475 host target gene. PTDSS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTDSS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTDSS2 BINDING SITE, designated SEQ ID:25077, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21879] Another function of VGAM475 is therefore inhibition of Phosphatidylserine Synthase 2 (PTDSS2, Accession NM\_030783). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTDSS2. LOC115330 (Accession NM\_138445) is another VGAM475 host target gene. LOC115330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115330 BINDING SITE, designated SEQ ID:28812, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21880] Another function of VGAM475 is therefore inhibition of LOC115330 (Accession NM\_138445). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115330. LOC124446 (Accession XM\_058805) is another VGAM475 host target gene. LOC124446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124446 BINDING SITE, designated SEQ ID:36751, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21881] Another function of VGAM475 is therefore inhibition of LOC124446 (Accession XM\_058805). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC124446. LOC126299 (Accession XM\_059019) is another VGAM475 host target gene. LOC126299 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126299 BINDING SITE, designated SEQ ID:36817, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21882] Another function of VGAM475 is therefore inhibition of LOC126299 (Accession XM\_059019). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126299. LOC133584 (Accession XM\_059661) is another VGAM475 host target gene. LOC133584 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133584 BINDING SITE, designated SEQ ID:37047, to the nucleotide sequence of VGAM475 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3186.

[21883] Another function of VGAM475 is therefore inhibition of LOC133584 (Accession XM\_059661). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133584. LOC144347 (Accession XM\_084832) is another VGAM475 host target gene. LOC144347 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144347 BINDING SITE, designated SEQ ID:37725, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21884] Another function of VGAM475 is therefore inhibition of LOC144347 (Accession XM\_084832). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144347. LOC147991 (Accession XM\_085993) is another VGAM475 host target gene. LOC147991 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147991, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147991 BINDING SITE, designated SEQ ID:38437, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21885] Another function of VGAM475 is therefore inhibition of LOC147991 (Accession XM\_085993). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147991. LOC149175 (Accession XM\_086445) is another VGAM475 host target gene. LOC149175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149175 BINDING SITE, designated SEQ ID:38661, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21886] Another function of VGAM475 is therefore inhibition of LOC149175 (Accession XM\_086445). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC149175. LOC149301 (Accession XM\_086480) is another VGAM475 host target gene. LOC149301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149301 BINDING SITE, designated SEQ ID:38687, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21887] Another function of VGAM475 is therefore inhibition of LOC149301 (Accession XM\_086480). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149301. LOC151584 (Accession XM\_098089) is another VGAM475 host target gene. LOC151584 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151584 BINDING SITE, designated SEQ ID:41374, to

the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21888] Another function of VGAM475 is therefore inhibition of LOC151584 (Accession XM\_098089). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151584. LOC158835 (Accession XM\_088683) is another VGAM475 host target gene. LOC158835 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158835 BINDING SITE, designated SEQ ID:39896, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21889] Another function of VGAM475 is therefore inhibition of LOC158835 (Accession XM\_088683). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158835. LOC164397 (Accession XM\_092780) is another VGAM475 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40155, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21890] Another function of VGAM475 is therefore inhibition of LOC164397 (Accession XM\_092780). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164397. LOC166929 (Accession XM\_094192) is another VGAM475 host target gene. LOC166929 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166929 BINDING SITE, designated SEQ ID:40224, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21891] Another function of VGAM475 is therefore inhibition of LOC166929 (Accession XM\_094192). Accordingly, utilities

of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166929. LOC169026 (Accession XM\_095471) is another VGAM475 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40262, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21892] Another function of VGAM475 is therefore inhibition of LOC169026 (Accession XM\_095471). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC201194 (Accession XM\_117061) is another VGAM475 host target gene. LOC201194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201194 BINDING SITE, designated SEQ ID:43219, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21893] Another function of VGAM475 is therefore inhibition of LOC201194 (Accession XM\_117061). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201194. LOC221683 (Accession XM\_168089) is another VGAM475 host target gene. LOC221683 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221683 BINDING SITE, designated SEQ ID:45005, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21894] Another function of VGAM475 is therefore inhibition of LOC221683 (Accession XM\_168089). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221683. LOC222488 (Accession XM\_169440) is another VGAM475 host target gene. LOC222488 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222488 BINDING SITE, designated SEQ ID:45301, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21895] Another function of VGAM475 is therefore inhibition of LOC222488 (Accession XM\_169440). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222488. LOC253613 (Accession XM\_171225) is another VGAM475 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46008, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21896] Another function of VGAM475 is therefore inhibition of

LOC253613 (Accession XM\_171225). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. LOC254423 (Accession XM\_173286) is another VGAM475 host target gene. LOC254423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254423 BINDING SITE, designated SEQ ID:46530, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21897] Another function of VGAM475 is therefore inhibition of LOC254423 (Accession XM\_173286). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254423. LOC255045 (Accession XM\_171243) is another VGAM475 host target gene. LOC255045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC255045 BINDING SITE, designated SEQ ID:46035, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21898] Another function of VGAM475 is therefore inhibition of LOC255045 (Accession XM\_171243). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255045. LOC257153 (Accession XM\_171047) is another VGAM475 host target gene. LOC257153 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257153 BINDING SITE, designated SEQ ID:45826, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21899] Another function of VGAM475 is therefore inhibition of LOC257153 (Accession XM\_171047). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257153. LOC51667 (Accession NM\_016118) is an-

other VGAM475 host target gene. LOC51667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51667 BINDING SITE, designated SEQ ID:18198, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21900] Another function of VGAM475 is therefore inhibition of LOC51667 (Accession NM\_016118). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51667. LOC55901 (Accession NM\_018676) is another VGAM475 host target gene. LOC55901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC55901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55901 BINDING SITE, designated SEQ ID:20750, to the nucleotide sequence of VGAM475 RNA, herein designated VGAM RNA, also designated SEQ ID:3186.

[21901] Another function of VGAM475 is therefore inhibition of LOC55901 (Accession NM\_018676). Accordingly, utilities of VGAM475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55901. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 476 (VGAM476) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21902] VGAM476 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM476 was detected is described hereinabove with reference to Figs. 1–8.

[21903] VGAM476 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tick-borne Encephalitis Virus. VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21904] VGAM476 gene encodes a VGAM476 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM476

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM476 precursor RNA is designated SEQ ID:462, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:462 is located at position 8886 relative to the genome of Tick-borne Encephalitis Virus.

[21905] VGAM476 precursor RNA folds onto itself, forming VGAM476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21906] An enzyme complex designated DICER COMPLEX, `dices` the VGAM476 folded precursor RNA into VGAM476 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM476 RNA is designated SEQ ID:3187, and is provided hereinbelow with reference to the sequence listing part.

[21907] VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM476 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[21908] VGAM476 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM476 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM476 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21909] The complementary binding of VGAM476 RNA, herein designated VGAM RNA, to host target binding sites on VGAM476 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM476 host target RNA into VGAM476 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21910] It is appreciated that VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM476 host target genes. The mRNA of each one of this plurality of VGAM476 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM476 RNA, herein designated VGAM RNA, and which when bound by VGAM476 RNA causes inhibition of translation of respective one or more VGAM476 host target proteins.

[21911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM476 gene, herein designated VGAM GENE, on one or more VGAM476 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21912] It is yet further appreciated that a function of VGAM476 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of viral infection by Tick-borne Encephalitis Virus. Specific functions, and accordingly utilities, of VGAM476 correlate with, and may be deduced from, the identity of the host target genes which VGAM476 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[21913] Nucleotide sequences of the VGAM476 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM476 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM476 are further described hereinbelow with reference to Table 1.

[21914] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM476 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM476 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[21915] As mentioned hereinabove with reference to Fig. 1, a function of VGAM476 gene, herein designated VGAM is inhibition of expression of VGAM476 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM476 correlate with, and may be deduced from, the identity of the target genes which VGAM476 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21916] BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM\_001519) is a VGAM476 host target gene. BRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRF1 BINDING SITE, designated SEQ ID:7255, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21917] A function of VGAM476 is therefore inhibition of BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession

NM\_001519), a gene which is a general activator of RNA polymerase III. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRF1. The function of BRF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM232.Chemokine (C-X3-C motif) Receptor 1

(CX3CR1, Accession XM\_047502) is another VGAM476 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34982, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21918] Another function of VGAM476 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM\_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM476 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943) is another VGAM476 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38409, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21919] Another function of VGAM476 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM55. Potassium Voltage-gated Channel, Shaw-related Subfamily, Member 3 (KCNC3, Accession NM\_004977) is another VGAM476 host target gene. KCNC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNC3 BINDING SITE, designated SEQ ID:11420, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21920] Another function of VGAM476 is therefore inhibition of Potassium Voltage-gated Channel, Shaw-related Subfamily, Member 3 (KCNC3, Accession NM\_004977), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNC3. The function of KCNC3 has been established by previous studies. Several genes (the Shaker or Sh gene family) encoding components of voltage-gated K(+) chan-

nels have been identified in various species. Based on sequence similarities, Sh genes are classified into 4 groups or subfamilies. Mammalian genes of each one of these subfamilies also show high levels of sequence similarity to 1 of 4 related *Drosophila* genes: Shaker, Shab, Shaw, and Shal. By fluorescence in situ hybridization, Ried et al. (1993) showed that the gene encoding a Shaw-related product previously studied in rat and mouse maps to 11p15 in a region that shows homology of synteny with a region of mouse chromosome 7. Because the prolonged QT syndrome (OMIM Ref. No. 192500) maps to this same region and because of pathophysiologic plausibility, mutations in the KCNC1 gene should be sought in that disorder. Grissmer et al. (1992) mapped the gene for the Shaw-related potassium channel in T cells to chromosome 11. This was referred to as Kv3.1. The related Kv1.1 and Kv3.2 genes were localized to chromosome 12, while the ISK gene (OMIM Ref. No. 176261) mapped to chromosome 21. Stubbs et al. (1994) established a long-range physical map of the region of mouse chromosome 7 containing 6 genes located within a 500-kb interval just proximal of the pink-eyed dilution (p) locus (OMIM Ref. No. 203200): Ldh1 (OMIM Ref. No. 150000), Ldh3 (OMIM Ref. No.

150150), Saa (OMIM Ref. No. 104750), Tph (OMIM Ref. No. 191060), Kcnc1, and Myod1 (OMIM Ref. No. 159970). The findings, together with mapping studies within the related region of human 11p15, demonstrated that gene content and organization within this homology segment had been highly conserved throughout evolution.

[21921] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21922] Ried, T.; Rudy, B.; Vega-Saenz de Miera, E.; Lau, D.; Ward, D. C.; Sen, K. : Localization of a highly conserved human potassium channel gene (NGK2-KV4; KCNC1) to chromosome 11p15. Genomics 15: 405-411, 1993. ; and

[21923] Stubbs, L.; Rinchik, E. M.; Goldberg, E.; Rudy, B.; Handel, M. A.; Johnson, D. : Clustering of six human 11p15 gene homologs within a 500-kb interval of proximal mouse chromosome 7. Gen.

[21924] Further studies establishing the function and utilities of KCNC3 are found in John Hopkins OMIM database record ID 176264, and in cited publications numbered 10927 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Inwardly-rectifying Channel, Subfamily J, Member 10

(KCNJ10, Accession NM\_002241) is another VGAM476 host target gene. KCNJ10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:8024, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21925] Another function of VGAM476 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM\_002241), a gene which may be responsible for potassium buffering action of glial cells in the brain. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10. The function of KCNJ10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167. Latent Transforming Growth Factor Beta Binding Protein 2 (LTBP2, Accession NM\_000428) is another VGAM476 host target gene. LTBP2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by LTBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTBP2 BINDING SITE, designated SEQ ID:6004, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21926] Another function of VGAM476 is therefore inhibition of Latent Transforming Growth Factor Beta Binding Protein 2 (LTBP2, Accession NM\_000428), a gene which targets latent TGF-beta to the extracellular matrix. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTBP2. The function of LTBP2 has been established by previous studies. Transforming growth factors (TGFs) beta-1 (OMIM Ref. No. 190180), beta-2 (OMIM Ref. No. 190220), beta-3 (OMIM Ref. No. 190230), and others have both stimulatory and inhibitory effects on the growth of different cell types and play a role in the production and degradation of the extracellular matrix. TGF-beta molecules are secreted in the form of latent large molecular mass complexes that contain other proteins, such as

latent TGF-beta-1 binding protein (LTBP1; 150390). There is evidence that these binding proteins modulate TGF-beta bioavailability. Animal model experiments lend further support to the function of LTBP2. Dabovic et al. (2002) created an *Ltbp3*-null mutation in the mouse by gene targeting. Mice homozygous for the mutation developed craniofacial malformations by day 10. At 2 months, there was a pronounced rounding of the cranial vault, extension of the mandible beyond the maxilla, and kyphosis. Between 6 and 9 months of age, mutant mice also developed osteosclerosis and osteoarthritis. The pathologic changes were consistent with perturbed TGF-beta signaling in the skull and long bones

[21927] It is appreciated that the abovementioned animal model for LTBP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21928] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21929] Oklu, R.; Hesketh, R. : The latent transforming growth factor beta binding protein (LTBP) family. *Biochem. J.* 352: 601-610, 2000. ; and

[21930] Dabovic, B.; Chen, Y.; Colarossi, C.; Obata, H.; Zambuto, L.; Perle, M. A.; Rifkin, D. B. : Bone abnormalities in latent TGF-beta binding protein (Ltbp)-3-null mice indicate a role for Ltb.

[21931] Further studies establishing the function and utilities of LTBP2 are found in John Hopkins OMIM database record ID 602090, and in cited publications numbered 6357-635 and 12464-6360 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540) is another VGAM476 host target gene. ODF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ODF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODF2 BINDING SITE, designated SEQ ID:8385, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21932] Another function of VGAM476 is therefore inhibition of Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540), a gene which is very strongly similar to rat Odf2 . Accordingly, utilities of VGAM476 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with ODF2. The function of ODF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM363. Periaxin (PRX, Accession NM\_020956) is another VGAM476 host target gene. PRX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:21941, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21933] Another function of VGAM476 is therefore inhibition of Periaxin (PRX, Accession NM\_020956), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon-glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin-associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition. Accordingly, utilities of VGAM476 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with PRX. The function of PRX has been established by previous studies. The periaxin gene (PRX) encodes 2 PDZ-domain proteins, L- and S-periaxin, that are required for maintenance of peripheral nerve myelin. The PDZ domain, which consists of a nearly 90-amino acid protein-binding motif that interacts with the C termini of plasma membrane proteins and with the cortical cytoskeleton, has been implicated in the assembly of signaling complexes at sites of cell-cell contact. By FISH and electronic PCR (Schuler, 1997), Boerkoel et al. (2001) mapped the PRX gene between D19S324 and D19S223 within a BAC on 19q13.1-q13.2, a position showing conserved synteny with mouse chromosome 7 where the Prx gene maps (Gillespie et al., 1997). They pointed out that the interactions among L-periaxin, the cytoskeleton, and a membrane complex are reminiscent of the interactions among the proteins of the dystrophin-sarcoglycan complex (Cohn and Campbell, 2000) and the signaling complexes organized by other PDZ domain proteins. They hypothesized that mutations in cytoskeletal and membrane proteins interacting with L-periaxin may also cause Charcot-Marie-Tooth disease or related neu-

ropathies. In 3 unrelated patients with Dejerine–Sottas neuropathy (OMIM Ref. No. 145900), Boerkoel et al. (2001) identified recessive mutations in the PRX gene (605725.0001–605725.004). They mapped recessive Dejerine–Sottas neuropathy to 19q13.1–q13.2, a region associated with a severe autosomal recessive demyelinating neuropathy in a Lebanese family reported by Delague et al. (2000) as Charcot–Marie–Tooth disease type 4F. Animal model experiments lend further support to the function of PRX. Confirming the necessity of periaxin for maintenance of the myelin sheath, Gillespie et al. (2000) demonstrated that Prx  $-/-$  mice ensheath and myelinate peripheral axons apparently normally but subsequently develop a severe demyelinating neuropathy associated with allodynia (pain from non-noxious stimuli) and hyperalgesia (hypersensitivity to pain).

[21934] It is appreciated that the abovementioned animal model for PRX is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[21935] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21936] Takashima, H.; Boerkoel, C. F.; De Jonghe, P.; Ceuterick, C.; Martin, J.-J.; Voit, T.; Schroder, J.-M.; Williams, A.; Brophy, P. J.; Timmerman, V.; Lupski, J. R. : Periaxin mutations cause a broad spectrum of demyelinating neuropathies. *Ann. Neurol.* 51: 709–715, 2002. ; and

[21937] Boerkoel, C. F.; Takashima, H.; Stankiewicz, P.; Garcia, C. A.; Leber, S. M.; Rhee-Morris, L.; Lupski, J. R. : Periaxin mutations cause recessive Dejerine-Sottas neuropathy. *Am. J. Hum.*

[21938] Further studies establishing the function and utilities of PRX are found in John Hopkins OMIM database record ID 605725, and in cited publications numbered 3546, 6910, 6911–6912, 355 and 6913–6914 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ribosomal Protein L10 (RPL10, Accession NM\_006013) is another VGAM476 host target gene. RPL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL10 BINDING SITE, designated SEQ ID:12623, to the nucleotide sequence of VGAM476 RNA,

herein designated VGAM RNA, also designated SEQ ID:3187.

[21939] Another function of VGAM476 is therefore inhibition of Ribosomal Protein L10 (RPL10, Accession NM\_006013), a gene which may be a component of the 60S ribosomal subunit. Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL10. The function of RPL10 has been established by previous studies. Weissman et al. (1987) provided a functional assay for the identification of the suppressor gene(s) involved in Wilms tumor, by showing that introduction of a normal chromosome 11 into a Wilms tumor cell line completely abolished its tumorigenic action in nude mice. Dowdy et al. (1991) showed that this suppressor activity resided in the 11p15 and not in the 11p13 region; see Wilms tumor, type II (WT2; 194071). In an attempt to isolate a suppressor gene, Dowdy et al. (1991) performed a subtractive hybridization assay with the tumorigenic Wilms tumor cell line and its nontumorigenic derivative which contained an extra t(X;11) translocation chromosome. A single novel cDNA clone, designated QM, was identified and, as the QM mRNA was modulated between tumorigenic and nontumorigenic cell

lines, the QM gene was an attractive tumor-suppressor candidate gene. In the course of investigating disease genes in the Xqter region, van den Ouweland et al. (1992) found a cosmid that appeared to harbor the QM gene as it demonstrated 100% identity with the cDNA sequence published by Dowdy et al. (1991). With an exon-specific polymerase chain reaction, van den Ouweland et al. (1992) demonstrated that the genomic homolog of the QM cDNA is located in Xq28 in the region of the G6PD and color vision genes. No homologous sequences could be detected on 11p. Thus, the QM gene is not, per se, involved in the suppression of Wilms tumor. QM is a 214-amino acid polypeptide encoded by a gene previously designated DXS648. It contains a high percentage of charged amino acids and binds to the JUN oncogene (OMIM Ref. No. 165160) and to DNA. Although they found no matches between QM and any other known transcription factors in searches of DNA databases, Farmer et al. (1994) found a high degree of conservation throughout the first 175 residues of the protein when studies were performed on a diverse array of eukaryotes. Most notable was the considerable conservation of charged amino acids within specific regions. The rate of sequence divergence of the various

homologs was found to be slow, of the order of 1% change every 22 million years, consistent with a critical role of QM in eukaryotic cells. Farmer et al. (1994) suggested that QM belongs to a novel class of transcription regulatory proteins.

[21940] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21941] Dowdy, S. F.; Fasching, C. L.; Araujo, D.; Lai, K.-M.; Livanos, E.; Weissman, B. E.; Stanbridge, E. J. : Suppression of tumorigenicity in Wilms' tumor by the p15.5-p14 region of chromosome 11. Science 254: 293-295, 1991. ; and

[21942] Farmer, A. A.; Loftus, T. M.; Mills, A. A.; Sato, K. Y.; Neill, J. D.; Tron, T.; Yang, M.; Trumpower, B. L.; Stanbridge, E. J. : Extreme evolutionary conservation of QM, a novel c-Jun assoc.

[21943] Further studies establishing the function and utilities of RPL10 are found in John Hopkins OMIM database record ID 312173, and in cited publications numbered 8388-8394 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin M1 (CNNM1, Accession NM\_020348) is another VGAM476

host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21606, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21944] Another function of VGAM476 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM\_020348). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. DKFZP434N1511 (Accession XM\_166138) is another VGAM476 host target gene. DKFZP434N1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434N1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N1511 BINDING SITE, designated SEQ ID:43934, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3187.

[21945] Another function of VGAM476 is therefore inhibition of DKFZP434N1511 (Accession XM\_166138). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N1511. FLJ12770 (Accession NM\_032174) is another VGAM476 host target gene. FLJ12770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12770 BINDING SITE, designated SEQ ID:25884, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21946] Another function of VGAM476 is therefore inhibition of FLJ12770 (Accession NM\_032174). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12770. FLJ13964 (Accession NM\_032186) is another VGAM476 host target gene. FLJ13964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13964, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13964 BINDING SITE, designated SEQ ID:25901, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21947] Another function of VGAM476 is therefore inhibition of FLJ13964 (Accession NM\_032186). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13964. FLJ20040 (Accession NM\_018992) is another VGAM476 host target gene. FLJ20040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20040 BINDING SITE, designated SEQ ID:21065, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21948] Another function of VGAM476 is therefore inhibition of FLJ20040 (Accession NM\_018992). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20040. FLJ22551 (Accession NM\_024708) is another VGAM476 host target gene. FLJ22551 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22551 BINDING SITE, designated SEQ ID:24025, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21949] Another function of VGAM476 is therefore inhibition of FLJ22551 (Accession NM\_024708). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22551. KIAA0084 (Accession XM\_042841) is another VGAM476 host target gene. KIAA0084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0084 BINDING SITE, designated SEQ ID:33805, to the nucleotide sequence of

VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21950] Another function of VGAM476 is therefore inhibition of KIAA0084 (Accession XM\_042841). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0084. KIAA0806 (Accession NM\_014813) is another VGAM476 host target gene. KIAA0806 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0806 BINDING SITE, designated SEQ ID:16779, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21951] Another function of VGAM476 is therefore inhibition of KIAA0806 (Accession NM\_014813). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0806. KIAA1950 (Accession XM\_166532) is another VGAM476 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44483, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21952] Another function of VGAM476 is therefore inhibition of KIAA1950 (Accession XM\_166532). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM\_046751) is another VGAM476 host target gene. PPFIA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPFIA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPFIA4 BINDING SITE, designated SEQ ID:34819, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21953] Another function of VGAM476 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM\_046751). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIA4. SSB-3 (Accession NM\_080861) is another VGAM476 host target gene. SSB-3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSB-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-3 BINDING SITE, designated SEQ ID:28100, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21954] Another function of VGAM476 is therefore inhibition of SSB-3 (Accession NM\_080861). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-3. LOC115051 (Accession XM\_010647) is another VGAM476 host target gene. LOC115051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115051, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115051 BINDING SITE, designated SEQ ID:30159, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21955] Another function of VGAM476 is therefore inhibition of LOC115051 (Accession XM\_010647). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115051. LOC127845 (Accession XM\_059186) is another VGAM476 host target gene. LOC127845 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC127845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127845 BINDING SITE, designated SEQ ID:36911, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21956] Another function of VGAM476 is therefore inhibition of LOC127845 (Accession XM\_059186). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC127845. LOC158056 (Accession XM\_088463) is another VGAM476 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39714, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21957] Another function of VGAM476 is therefore inhibition of LOC158056 (Accession XM\_088463). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. LOC196955 (Accession XM\_085210) is another VGAM476 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37927, to

the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21958] Another function of VGAM476 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC256158 (Accession XM\_175125) is another VGAM476 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46619, to the nucleotide sequence of VGAM476 RNA, herein designated VGAM RNA, also designated SEQ ID:3187.

[21959] Another function of VGAM476 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 477 (VGAM477) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21960] VGAM477 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM477 was detected is described hereinabove with reference to Figs. 1–8.

[21961] VGAM477 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21962] VGAM477 gene encodes a VGAM477 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM477 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM477 precursor RNA is designated SEQ ID:463, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:463 is located at position 6061 relative to the genome of Hepatitis G Virus.

[21963] VGAM477 precursor RNA folds onto itself, forming VGAM477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21964] An enzyme complex designated DICER COMPLEX, `dices` the VGAM477 folded precursor RNA into VGAM477 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM477 RNA is designated SEQ ID:3188, and is provided hereinbelow with reference to the sequence listing part.

[21965] VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM477 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM477 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[21966] VGAM477 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM477 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM477 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[21967] The complementary binding of VGAM477 RNA, herein designated VGAM RNA, to host target binding sites on VGAM477 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM477 host target RNA into VGAM477 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[21968] It is appreciated that VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM477 host target genes. The mRNA of each one of this plurality of VGAM477 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM477 RNA, herein designated VGAM RNA, and which when bound by VGAM477 RNA causes inhibition of translation of respective one or more VGAM477 host target proteins.

[21969] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM477 gene, herein designated VGAM GENE, on one or more VGAM477 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[21970] It is yet further appreciated that a function of VGAM477 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM477 correlate with, and may be deduced from, the identity of the host

target genes which VGAM477 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [21971] Nucleotide sequences of the VGAM477 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM477 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM477 are further described hereinbelow with reference to Table 1.
- [21972] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM477 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM477 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [21973] As mentioned hereinabove with reference to Fig. 1, a function of VGAM477 gene, herein designated VGAM is inhibition of expression of VGAM477 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM477 correlate with, and may be deduced from, the identity of the target genes which VGAM477

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[21974] Adenylate Cyclase 9 (ADCY9, Accession NM\_001116) is a VGAM477 host target gene. ADCY9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY9 BINDING SITE, designated SEQ ID:6791, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21975] A function of VGAM477 is therefore inhibition of Adenylate Cyclase 9 (ADCY9, Accession NM\_001116), a gene which . may be a physiologically relevant docking site for calcineurin (by similarity). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY9. The function of ADCY9 has been established by previous studies. The adenylyl cyclases (EC 4.6.1.1) are membrane-associated enzymes that are expressed in most human tissues. These enzymes catalyze the formation of cAMP and are regulated by a family of G protein-coupled recep-

tors, protein kinases, and calcium. The type 9 adenylyl cyclase (ADCY9) is a widely distributed adenylyl cyclase that was originally cloned from mouse (Paterson et al., 1995; Premont et al., 1996). Hacker et al. (1998) cloned human cardiac ADCY9, or AC9, cDNAs and found that the deduced 1,294-amino acid protein is 90% identical to mouse Adcy9. Like mouse Adcy9, the predicted human ADCY9 protein contains 12 transmembrane domains, Asn-linked glycosylation sites, and cAMP-dependent protein kinase phosphorylation sites; however, these proteins differ in the C2b domain due to a frameshift in the human ADCY9 coding sequence relative to the coding sequence of mouse Adcy9. Northern blot analysis detected 8.5- and 6.3-kb ADCY9 transcripts in all human tissues examined. By fluorescence in situ hybridization, Hacker et al. (1998) mapped the human and mouse ADCY9 genes to 16p13.3 and chromosome 16 band B1, respectively.

[21976] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[21979] Further studies establishing the function and utilities of ADCY9 are found in John Hopkins OMIM database record ID 603302, and in cited publications numbered 2438–2441 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104) is another VGAM477 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:14414 and SEQ ID:29082 respectively, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21980] Another function of VGAM477 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession

NM\_012104), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Fibroblast Growth Factor Receptor-like 1 (FGFRL1, Accession NM\_021923) is another VGAM477 host target gene. FGFRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGFRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFRL1 BINDING SITE, designated SEQ ID:22449, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21981] Another function of VGAM477 is therefore inhibition of Fibroblast Growth Factor Receptor-like 1 (FGFRL1, Accession NM\_021923). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFRL1. COAS3

(Accession NM\_139020) is another VGAM477 host target gene. COAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COAS3 BINDING SITE, designated SEQ ID:29120, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21982] Another function of VGAM477 is therefore inhibition of COAS3 (Accession NM\_139020). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COAS3. FLJ00058 (Accession XM\_086123) is another VGAM477 host target gene. FLJ00058 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ00058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00058 BINDING SITE, designated SEQ ID:38507, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3188.

[21983] Another function of VGAM477 is therefore inhibition of FLJ00058 (Accession XM\_086123). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00058. KIAA0446 (Accession XM\_044155) is another VGAM477 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34147, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21984] Another function of VGAM477 is therefore inhibition of KIAA0446 (Accession XM\_044155). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. KIAA0563 (Accession NM\_014834) is another VGAM477 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0563, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16844, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21985] Another function of VGAM477 is therefore inhibition of KIAA0563 (Accession NM\_014834). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. KIAA1550 (Accession XM\_039393) is another VGAM477 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33066, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21986] Another function of VGAM477 is therefore inhibition of KIAA1550 (Accession XM\_039393). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1550. KIAA1884 (Accession XM\_055539) is another VGAM477 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36290, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21987] Another function of VGAM477 is therefore inhibition of KIAA1884 (Accession XM\_055539). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. MGC12921 (Accession XM\_033362) is another VGAM477 host target gene. MGC12921 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12921, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12921 BINDING SITE, designated SEQ ID:31898, to

the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21988] Another function of VGAM477 is therefore inhibition of MGC12921 (Accession XM\_033362). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12921. RA-GEF-2 (Accession NM\_016340) is another VGAM477 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RA-GEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:18463, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21989] Another function of VGAM477 is therefore inhibition of RA-GEF-2 (Accession NM\_016340). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. LOC147071 (Accession XM\_054031) is another VGAM477 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:36139, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21990] Another function of VGAM477 is therefore inhibition of LOC147071 (Accession XM\_054031). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC154141 (Accession XM\_098482) is another VGAM477 host target gene. LOC154141 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154141 BINDING SITE, designated SEQ ID:41686, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21991] Another function of VGAM477 is therefore inhibition of LOC154141 (Accession XM\_098482). Accordingly, utilities

of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154141. LOC201173 (Accession XM\_113312) is another VGAM477 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:42218, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21992] Another function of VGAM477 is therefore inhibition of LOC201173 (Accession XM\_113312). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM\_113321) is another VGAM477 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201220 BINDING SITE, designated SEQ ID:42227, to the nucleotide sequence of VGAM477 RNA, herein designated VGAM RNA, also designated SEQ ID:3188.

[21993] Another function of VGAM477 is therefore inhibition of LOC201220 (Accession XM\_113321). Accordingly, utilities of VGAM477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 478 (VGAM478) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[21994] VGAM478 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM478 was detected is described hereinabove with reference to Figs. 1–8.

[21995] VGAM478 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM478 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[21996] VGAM478 gene encodes a VGAM478 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM478 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM478 precursor RNA is designated SEQ ID:464, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:464 is located at position 8794 relative to the genome of Hepatitis G Virus.

[21997] VGAM478 precursor RNA folds onto itself, forming VGAM478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[21998] An enzyme complex designated DICER COMPLEX, `dices` the VGAM478 folded precursor RNA into VGAM478 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM478 RNA is designated SEQ ID:3189, and is provided hereinbelow with reference to the sequence listing part.

[21999] VGAM478 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM478 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22000] VGAM478 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM478 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM478 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22001] The complementary binding of VGAM478 RNA, herein designated VGAM RNA, to host target binding sites on VGAM478 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM478 host target RNA into VGAM478 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22002] It is appreciated that VGAM478 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM478 host target genes. The mRNA of each one of this plurality of VGAM478 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM478 RNA, herein designated VGAM RNA, and which when bound by VGAM478 RNA causes inhibition of translation of respective one or more VGAM478 host target proteins.

[22003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM478 gene, herein designated VGAM GENE, on one or more VGAM478 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[22004] It is yet further appreciated that a function of VGAM478 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM478 correlate with, and may be deduced from, the identity of the host target genes which VGAM478 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22005] Nucleotide sequences of the VGAM478 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM478 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM478 are further described hereinbelow with reference to Table 1.

[22006] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM478 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM478 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22007] As mentioned hereinabove with reference to Fig. 1, a function of VGAM478 gene, herein designated VGAM is inhibition of expression of VGAM478 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM478 correlate with, and may be deduced from, the identity of the target genes which VGAM478 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22008] ATPase, Cu<sup>++</sup> Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053) is a VGAM478 host target gene. ATP7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5504, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22009] A function of VGAM478 is therefore inhibition of ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM\_000053). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B. Multiple Endocrine Neoplasia I (MEN1, Accession NM\_130804) is another VGAM478 host target gene. MEN1 BINDING SITE1 through MEN1 BINDING SITE7 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE1 through MEN1 BINDING SITE7, designated SEQ ID:28300, SEQ ID:5773, SEQ ID:28287, SEQ ID:28289, SEQ ID:28291, SEQ ID:28293 and SEQ ID:28296 respectively, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22010] Another function of VGAM478 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession NM\_130804). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. DKFZp762E1511

(Accession XM\_003460) is another VGAM478 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:29930, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22011] Another function of VGAM478 is therefore inhibition of DKFZp762E1511 (Accession XM\_003460). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. FLJ20312 (Accession NM\_017761) is another VGAM478 host target gene. FLJ20312 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20312 BINDING SITE, designated SEQ ID:19375, to the nucleotide sequence of VGAM478 RNA, herein designated

VGAM RNA, also designated SEQ ID:3189.

[22012] Another function of VGAM478 is therefore inhibition of FLJ20312 (Accession NM\_017761). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20312. KIAA1239 (Accession XM\_049078) is another VGAM478 host target gene. KIAA1239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1239 BINDING SITE, designated SEQ ID:35339, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22013] Another function of VGAM478 is therefore inhibition of KIAA1239 (Accession XM\_049078). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1239. Peptidylprolyl Isomerase (cyclophilin)-like 3 (PPIL3, Accession NM\_131916) is another VGAM478 host target gene. PPIL3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by PPIL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIL3 BINDING SITE, designated SEQ ID:28393, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22014] Another function of VGAM478 is therefore inhibition of Peptidylprolyl Isomerase (cyclophilin)-like 3 (PPIL3, Accession NM\_131916). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL3. LOC144962 (Accession XM\_084990) is another VGAM478 host target gene. LOC144962 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144962 BINDING SITE, designated SEQ ID:37791, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22015] Another function of VGAM478 is therefore inhibition of

LOC144962 (Accession XM\_084990). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144962. LOC150397 (Accession XM\_086907) is another VGAM478 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38960, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22016] Another function of VGAM478 is therefore inhibition of LOC150397 (Accession XM\_086907). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC152359 (Accession XM\_098213) is another VGAM478 host target gene. LOC152359 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152359, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152359 BINDING SITE, designated SEQ ID:41493, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22017] Another function of VGAM478 is therefore inhibition of LOC152359 (Accession XM\_098213). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152359. LOC220522 (Accession XM\_018306) is another VGAM478 host target gene. LOC220522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220522 BINDING SITE, designated SEQ ID:30351, to the nucleotide sequence of VGAM478 RNA, herein designated VGAM RNA, also designated SEQ ID:3189.

[22018] Another function of VGAM478 is therefore inhibition of LOC220522 (Accession XM\_018306). Accordingly, utilities of VGAM478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220522. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 479 (VGAM479) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22019] VGAM479 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM479 was detected is described hereinabove with reference to Figs. 1–8.

[22020] VGAM479 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM479 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22021] VGAM479 gene encodes a VGAM479 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM479 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM479 precursor RNA is designated SEQ ID:465, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:465 is

located at position 3988 relative to the genome of Hepatitis G Virus.

[22022] VGAM479 precursor RNA folds onto itself, forming VGAM479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22023] An enzyme complex designated DICER COMPLEX, `dices` the VGAM479 folded precursor RNA into VGAM479 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM479 RNA is designated SEQ ID:3190, and is provided hereinbelow with reference to the sequence listing part.

[22024] VGAM479 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM479 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[22025] VGAM479 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM479 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM479 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM479 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[22026] The complementary binding of VGAM479 RNA, herein designated VGAM RNA, to host target binding sites on VGAM479 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM479 host target RNA into VGAM479 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22027] It is appreciated that VGAM479 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM479 host target genes. The mRNA of each one of this plurality of VGAM479 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM479 RNA, herein designated VGAM RNA, and which when bound by VGAM479 RNA causes inhibition of translation of respective one or more VGAM479

host target proteins.

[22028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM479 gene, herein designated VGAM GENE, on one or more VGAM479 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22029] It is yet further appreciated that a function of VGAM479 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM479 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific

functions, and accordingly utilities, of VGAM479 correlate with, and may be deduced from, the identity of the host target genes which VGAM479 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22030] Nucleotide sequences of the VGAM479 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM479 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM479 are further described hereinbelow with reference to Table 1.

[22031] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM479 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM479 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22032] As mentioned hereinabove with reference to Fig. 1, a function of VGAM479 gene, herein designated VGAM is inhibition of expression of VGAM479 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM479 correlate with, and may be deduced from, the identity of the target genes which VGAM479 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22033] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_004996) is a VGAM479 host target gene. ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC1 BINDING SITE1 through ABCC1 BINDING SITE3, designated SEQ ID:11440, SEQ ID:21284 and SEQ ID:21288 respectively, to the nucleotide sequence of VGAM479 RNA, herein designated VGAM RNA, also designated SEQ ID:3190.

[22034] A function of VGAM479 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 1 (ABCC1, Accession NM\_004996), a gene which may participate directly in the active transport of drugs into sub-cellular organelles or influence drug distribution indirectly. Accordingly, utilities of VGAM479 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with ABCC1. The function of ABCC1 has been established by previous studies. Cole et al. (1992) identified a transporter protein whose gene is overexpressed in a multidrug-resistant variant of the small cell lung cancer cell line NCI-H69. Unlike most tumor cell lines that are resistant to multiple chemotherapeutic agents, it did not overexpress the transmembrane transport protein P-glycoprotein (MDR1; 171050). Cole et al. (1992) isolated cDNA clones corresponding to mRNAs overexpressed in the resistant H69 cells. One cDNA hybridized to an mRNA of 7.8 to 8.2 kb that was expressed 100- to 200-fold higher in the resistant cells than in the drug-sensitive H69 cells. Overexpression was associated with amplification of the cognate gene. The cDNA contained a single open reading frame of 1,522 amino acids encoding a protein that they designated MRP, for 'multidrug resistance-associated protein.' Database analyses demonstrated similarities in primary sequence to the adenosine triphosphate (ATP)-binding cassette (ABC) superfamily of transport systems. Included in this superfamily are the genes for MDR1 and for the cystic fibrosis transmembrane conductance regulator (CFTR; 602421). Northern blot

analysis readily detected MRP transcripts in lung, testis, and peripheral blood mononuclear cells; MRP transcripts were below the level of detection in placenta, brain, kidney, salivary gland, uterus, liver, and spleen. By isotopic in situ hybridization, Cole et al. (1992) mapped the MRP1 gene to chromosome 16p13.1. Grant et al. (1997) located the MRP1 gene close to the short arm breakpoint of the pericentric inversion associated with the M4Eo subclass of acute myeloid leukemia and on the telomeric side of the MYH11 gene (OMIM Ref. No. 160745).

[22035] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22036] Cole, S. P. C.; Bhardwaj, G.; Gerlach, J. H.; Mackie, J. E.; Grant, C. E.; Almquist, K. C.; Stewart, A. J.; Kurz, E. U.; Duncan, A. M. V.; Deeley, R. G. : Overexpression of a transporter gene in a multidrug-resistant human lung cancer cell line. *Science* 258: 1650–1654, 1992. ; and

[22037] Grant, C. E.; Kurz, E. U.; Cole, S. P. C.; Deeley, R. G. : Analysis of the intron–exon organization of the human multidrug–resistance protein gene (MRP) and alternative splicing of its m.

[22038] Further studies establishing the function and utilities of

ABCC1 are found in John Hopkins OMIM database record ID 158343, and in cited publications numbered 2530–2536 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chemokine (C–C motif) Receptor 5 (CCR5, Accession NM\_000579) is another VGAM479 host target gene. CCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:6186, to the nucleotide sequence of VGAM479 RNA, herein designated VGAM RNA, also designated SEQ ID:3190.

[22039] Another function of VGAM479 is therefore inhibition of Chemokine (C–C motif) Receptor 5 (CCR5, Accession NM\_000579). Accordingly, utilities of VGAM479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5. KIAA1265 (Accession XM\_047707) is another VGAM479 host target gene. KIAA1265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1265, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1265 BINDING SITE, designated SEQ ID:35035, to the nucleotide sequence of VGAM479 RNA, herein designated VGAM RNA, also designated SEQ ID:3190.

[22040] Another function of VGAM479 is therefore inhibition of KIAA1265 (Accession XM\_047707). Accordingly, utilities of VGAM479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1265. PDZ Domain Containing 2 (PDZD2, Accession XM\_087705) is another VGAM479 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39386, to the nucleotide sequence of VGAM479 RNA, herein designated VGAM RNA, also designated SEQ ID:3190.

[22041] Another function of VGAM479 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession

XM\_087705). Accordingly, utilities of VGAM479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. LOC150372 (Accession XM\_086893) is another VGAM479 host target gene. LOC150372 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150372 BINDING SITE, designated SEQ ID:38943, to the nucleotide sequence of VGAM479 RNA, herein designated VGAM RNA, also designated SEQ ID:3190.

[22042] Another function of VGAM479 is therefore inhibition of LOC150372 (Accession XM\_086893). Accordingly, utilities of VGAM479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150372. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 480 (VGAM480) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[22043] VGAM480 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM480 was detected is described hereinabove with reference to Figs. 1–8.

[22044] VGAM480 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM480 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22045] VGAM480 gene encodes a VGAM480 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM480 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM480 precursor RNA is designated SEQ ID:466, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:466 is located at position 4279 relative to the genome of Hepatitis G Virus.

[22046] VGAM480 precursor RNA folds onto itself, forming VGAM480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[22047] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM480 folded precursor RNA into VGAM480 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 65%) nucleotide se-  
quence of VGAM480 RNA is designated SEQ ID:3191, and  
is provided hereinbelow with reference to the sequence  
listing part.

[22048] VGAM480 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM480 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM480 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[22049] VGAM480 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM480 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM480 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[22050] The complementary binding of VGAM480 RNA, herein designated VGAM RNA, to host target binding sites on VGAM480 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM480 host target RNA into VGAM480 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22051] It is appreciated that VGAM480 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM480 host target genes. The mRNA of each one of this plurality of VGAM480 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM480 RNA, herein designated VGAM RNA, and which when bound by VGAM480 RNA causes inhibition of translation of respective one or more VGAM480 host target proteins.

[22052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM480 gene, herein designated VGAM GENE, on one or

more VGAM480 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22053] It is yet further appreciated that a function of VGAM480 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM480 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM480 correlate with, and may be deduced from, the identity of the host target genes which VGAM480 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22054] Nucleotide sequences of the VGAM480 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM480 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM480 are further described hereinbelow with reference to Table 1.

[22055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM480 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM480 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22056] As mentioned hereinabove with reference to Fig. 1, a function of VGAM480 gene, herein designated VGAM is inhibition of expression of VGAM480 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM480 correlate with, and may be deduced from, the identity of the target genes which VGAM480 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22057] Myozenin 1 (MYOZ1, Accession NM\_021245) is a

VGAM480 host target gene. MYOZ1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYOZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYOZ1 BINDING SITE, designated SEQ ID:22213, to the nucleotide sequence of VGAM480 RNA, herein designated VGAM RNA, also designated SEQ ID:3191.

[22058] A function of VGAM480 is therefore inhibition of Myozenin 1 (MYOZ1, Accession NM\_021245), a gene which modulates the function and substrate specificity of calcineurin in striated muscle cells. Accordingly, utilities of VGAM480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYOZ1. The function of MYOZ1 has been established by previous studies. Calcineurin (see OMIM Ref. No. 114105) is a calcium/calmodulin-dependent serine-threonine phosphatase that plays an important role in transducing calcium-dependent signals in a variety of cell types. Calcineurin has also been shown to have a profound influence on the properties of striated muscle cells, including cardiac muscle. To identify potential cardiac-specific reg-

ulators of calcineurin, Frey et al. (2000) conducted a yeast 2-hybrid screen, using the catalytic A subunit of calcineurin as bait. They identified a novel family of striated muscle-specific calcineurin-interacting proteins called calsarcins. Calsarcins interact and colocalize with the Z-disc protein alpha-actinin (ACTN1; 102575) in vitro and in vivo and thereby tether calcineurin to the sarcomere of cardiac and skeletal muscle. These properties of calsarcins suggest an important role for these proteins in modulating the function and substrate specificity of calcineurin in striated muscle cells. Using the yeast 2-hybrid system, Takada et al. (2001) used sarcomeric isoforms of alpha-actinin and gamma-filamin to screen a human skeletal muscle cDNA library for interacting proteins. The aim was to understand better the structure and function of Z lines. They described the characteristics of myozenin. It is predicted to be a 32-kD globular protein with a central glycine-rich domain flanked by alpha-helical regions with no strong homologies to any known genes. The MYOZ gene has 6 exons and maps to chromosome 10q22.1-q22.2; a homologous EST in the public database had been mapped to 10q22.1 by radiation hybrid mapping. Takada et al. (2001) considered myozenin as a

skeletal muscle Z-line protein to be a candidate gene for limb-girdle muscular dystrophy or other neuromuscular disorders.

[22059] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22060] Frey, N.; Richardson, J. A.; Olson, E. N. : Calsarcins, a novel family of sarcomeric calcineurin-binding proteins. Proc. Nat. Acad. Sci. 97: 14632-14637, 2000. ; and

[22061] Takada, F.; Vander Woude, D. L.; Tong, H.-Q.; Thompson, T. G.; Watkins, S. C.; Kunkel, L. M.; Beggs, A. H. : Myozenin: an alpha-actinin- and gamma-filamin-binding protein of skeletal m.

[22062] Further studies establishing the function and utilities of MYOZ1 are found in John Hopkins OMIM database record ID 605603, and in cited publications numbered 700 and 7004 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Baculoviral IAP Repeat-containing 8 (BIRC8, Accession NM\_033341) is another VGAM480 host target gene. BIRC8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC8 BINDING SITE, designated SEQ ID:27195, to the nucleotide sequence of VGAM480 RNA, herein designated VGAM RNA, also designated SEQ ID:3191.

[22063] Another function of VGAM480 is therefore inhibition of Baculoviral IAP Repeat-containing 8 (BIRC8, Accession NM\_033341). Accordingly, utilities of VGAM480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC8. DKFZp762M136 (Accession XM\_035635) is another VGAM480 host target gene. DKFZp762M136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762M136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762M136 BINDING SITE, designated SEQ ID:32301, to the nucleotide sequence of VGAM480 RNA, herein designated VGAM RNA, also designated SEQ ID:3191.

[22064] Another function of VGAM480 is therefore inhibition of DKFZp762M136 (Accession XM\_035635). Accordingly, utilities of VGAM480 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp762M136. FLJ20449 (Accession NM\_017826) is another VGAM480 host target gene. FLJ20449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20449 BINDING SITE, designated SEQ ID:19485, to the nucleotide sequence of VGAM480 RNA, herein designated VGAM RNA, also designated SEQ ID:3191.

[22065] Another function of VGAM480 is therefore inhibition of FLJ20449 (Accession NM\_017826). Accordingly, utilities of VGAM480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20449. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 481 (VGAM481) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22066] VGAM481 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM481 was detected is described hereinabove with reference to Figs. 1–8.

[22067] VGAM481 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus.

VGAM481 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22068] VGAM481 gene encodes a VGAM481 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM481 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM481 precursor RNA is designated SEQ ID:467, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:467 is located at position 2786 relative to the genome of Hepatitis G Virus.

[22069] VGAM481 precursor RNA folds onto itself, forming VGAM481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22070] An enzyme complex designated DICER COMPLEX, `dices` the VGAM481 folded precursor RNA into VGAM481 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM481 RNA is designated SEQ ID:3192, and is provided hereinbelow with reference to the sequence listing part.

[22071] VGAM481 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM481 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22072] VGAM481 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM481 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM481 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22073] The complementary binding of VGAM481 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM481 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM481 host target RNA into VGAM481 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22074] It is appreciated that VGAM481 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM481 host target genes. The mRNA of each one of this plurality of VGAM481 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM481 RNA, herein designated VGAM RNA, and which when bound by VGAM481 RNA causes inhibition of translation of respective one or more VGAM481 host target proteins.

[22075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM481 gene, herein designated VGAM GENE, on one or more VGAM481 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22076] It is yet further appreciated that a function of VGAM481 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM481 correlate with, and may be deduced from, the identity of the host target genes which VGAM481 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22077] Nucleotide sequences of the VGAM481 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM481 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM481 are further described hereinbelow with reference to Table 1.

[22078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM481 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM481 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22079] As mentioned hereinabove with reference to Fig. 1, a function of VGAM481 gene, herein designated VGAM is inhibition of expression of VGAM481 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM481 correlate with, and may be deduced from, the identity of the target genes which VGAM481 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22080] Adenylate Cyclase 7 (ADCY7, Accession NM\_001114) is a VGAM481 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY7, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6785, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22081] A function of VGAM481 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM\_001114), a gene which is a membrane-bound,  $Ca^{2+}$ -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108.BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM\_021813) is another VGAM481 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE,

designated SEQ ID:22380, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22082] Another function of VGAM481 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM\_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331.B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM\_001706) is another VGAM481 host target gene. BCL6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL6 BINDING SITE, designated SEQ ID:7430, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22083] Another function of VGAM481 is therefore inhibition of B-cell CLL/lymphoma 6 (zinc finger protein 51) (BCL6, Accession NM\_001706), a gene which is involved in the generation and maintenance of both T and B cells during immune responses. Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL6. The function of BCL6 has been established by previous studies. Chromosomal translocations involving chromosome 3q27 and immunoglobulin gene regions are among the most common rearrangements in B-cell non-Hodgkin lymphoma. Using a probe from the immunoglobulin heavy chain joining region locus (OMIM Ref. No. 147010), Baron et al. (1993) isolated genomic clones from a bacteriophage lambda library prepared from a lymphoma characterized by a translocation t(3;14)(q27;q32). Normal chromosome 3 sequences and the reciprocal breakpoint junction were isolated. DNA probes on each side of the chromosome 3 breakpoint hybridized at high stringency to the DNA of various mammalian species, demonstrating evolutionary conservation. A probe made from partial cDNA clones isolated from a T-cell line hybridized the genomic DNA from both sides of the chromosome 3 breakpoint, indicating

that the t(3;14) is associated with a break within the gene on chromosome 3. In situ chromosomal hybridization revealed that the same gene is involved in the t(3;22)(q27;q11). Preliminary nucleotide sequencing showed no identity of the cDNA to gene sequences in available data banks. Baron et al. (1993) proposed the name B-cell lymphoma-6 (BCL6) for this gene, which they presumed plays a role in the pathogenesis of certain B-cell lymphomas. Ye et al. (1993) cloned the BCL6 gene. Animal model experiments lend further support to the function of BCL6. Ichii et al. (2002) observed that the percentage of CD8 (see OMIM Ref. No. 186910)-positive T cells with a memory phenotype was lower in Bcl6 -/- mice than in wildtype mice, while the percentage of activated T cells was the same. Transgenic mice and 'rescued' Bcl6 -/- mice expressing the Bcl6 transgene specifically in T cells had levels of memory CD8 cells like those of wildtype mice. After antigenic stimulation, memory CD8 cells, which express CD44 (OMIM Ref. No. 107269), Ly6C (see OMIM Ref. No. LY6D; 606204), CD122 (OMIM Ref. No. 146710), and Bcl2 (OMIM Ref. No. 151430), differentiated into effector cells more rapidly than nonmemory CD8 cells in wildtype mice. Analysis of CD8-positive T-cell prolifer-

ation indicated that memory-type CD8 cells proliferated through a homeostatic mechanism in a Bcl6-dependent manner in the lymphopenic environment of very young mouse spleens. Ichii et al. (2002) concluded that BCL6 is involved in the generation and maintenance of both T and B cells during immune responses.

[22084] It is appreciated that the abovementioned animal model for BCL6 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[22085] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22086] Ye, B. H.; Rao, P. H.; Chaganti, R. S. K.; Dalla-Favera, R. : Cloning of bcl-6, the locus involved in chromosome translocations affecting band 3q27 in B-cell lymphoma. Cancer Res. 53: 2732-2735, 1993. ; and

[22087] Ichii, H.; Sakamoto, A.; Hatano, M.; Okada, S.; Toyama, H.; Taki, S.; Arima, M.; Kuroda, Y.; Tokuhisa, T. : Role of Bcl-6 in the generation and maintenance of memory CD8+ T cells. Natu.

[22088] Further studies establishing the function and utilities of BCL6 are found in John Hopkins OMIM database record ID

109565, and in cited publications numbered 1362–1371, 607, 1372–1378, 45 and 1379–1386 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heterogeneous Nuclear Ribonucleoprotein F (HNRPF, Accession NM\_004966) is another VGAM481 host target gene. HNRPF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HNRPF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPF BINDING SITE, designated SEQ ID:11415, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22089] Another function of VGAM481 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein F (HNRPF, Accession NM\_004966). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPF. Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM\_054111) is another VGAM481 host target gene. IHPK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IHPK3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK3 BINDING SITE, designated SEQ ID:27658, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22090] Another function of VGAM481 is therefore inhibition of Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM\_054111). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK3. Neuron Navigator 2 (NAV2, Accession XM\_012028) is another VGAM481 host target gene. NAV2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAV2 BINDING SITE, designated SEQ ID:30205, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22091] Another function of VGAM481 is therefore inhibition of Neuron Navigator 2 (NAV2, Accession XM\_012028), a

gene which plays an important role in neuronal development, including neurite outgrowth. Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV2. The function of NAV2 has been established by previous studies. The vitamin A metabolite, all-trans retinoic acid (atRA), plays an important role in neuronal development, including neurite outgrowth. RAINB1 is an atRA-responsive gene.

[22092] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22093] Merrill, R. A.; Plum, L. A.; Kaiser, M. E.; Clagett-Dame, M. : A mammalian homolog of unc-53 is regulated by all-trans retinoic acid in neuroblastoma cells and embryos. Proc. Nat. Acad. Sci. 99: 3422-3427, 2002. ; and

[22094] Nagase, T.; Kikuno, R.; Ishikawa, K.; Hirose, M.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XVI. The complete sequences of 150 new cDNA clones from.

[22095] Further studies establishing the function and utilities of NAV2 are found in John Hopkins OMIM database record ID 607026, and in cited publications numbered 538 and

6371 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. NKX3A (Accession NM\_006167) is another VGAM481 host target gene. NKX3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX3A BINDING SITE, designated SEQ ID:12826, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22096] Another function of VGAM481 is therefore inhibition of NKX3A (Accession NM\_006167), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX3A. The function of NKX3A has been established by previous studies. Using a random cDNA sequencing approach, He et al. (1997) cloned a novel prostate-specific gene that encodes a homeo box-containing protein. The gene, which they symbolized NKX3.1, encodes a deduced 234-amino acid polypeptide

with greatest homology to the *Drosophila* NK3 gene. Northern blot analysis showed that NKX3.1 had a uniquely restricted tissue expression pattern. The 3.5-kb NKX3.1 mRNA was abundant in the prostate, present at a lower level in the testis, and absent from all other tissues tested. He et al. (1997) detected NKX3.1 expression in a hormone-responsive, androgen receptor-positive prostate cancer cell line, but not in either of 2 androgen receptor-negative prostate cancer cell lines, or in 11 other cell lines of varied origin. Androgen stimulation markedly increased NKX3.1 expression in an androgen-dependent carcinoma line. The authors suggested that the NKX3.1 gene plays a role in androgen-driven differentiation of prostatic tissue and in the loss of that differentiation during the progression of prostate cancer. Animal model experiments lend further support to the function of NKX3A. Abdulkadir et al. (2002) found that conditional deletion of one or both alleles of *Nkx3.1* in transgenic mice led to the development of preinvasive lesions resembling human prostatic intraepithelial neoplasia.

[22097] It is appreciated that the abovementioned animal model for NKX3A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[22098] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22099] Abdulkadir, S. A.; Magee, J. A.; Peters, T. J.; Kaleem, Z.; Naughton, C. K.; Humphrey, P. A.; Milbrandt, J. : Conditional loss of Nkx3.1 in adult mice induces prostatic intraepithelial neoplasia. *Molec. Cell. Biol.* 22: 1495–1503, 2002. ; and

[22100] He, W. W.; Sciavolino, P. J.; Wing, J.; Augustus, M.; Hudson, P.; Meissner, P. S.; Curtis, R. T.; Shell, B. K.; Bostwick, D. G.; Tindall, D. J.; Gelmann, E. P.; Abate-Shen, C.; Carter.

[22101] Further studies establishing the function and utilities of NKX3A are found in John Hopkins OMIM database record ID 602041, and in sited publications numbered 6656–665 and 6659 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromobox Homolog 6 (CBX6, Accession NM\_014292) is another VGAM481 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus–

trates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15576, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22102] Another function of VGAM481 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM\_014292). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665) is another VGAM481 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12207, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22103] Another function of VGAM481 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with EVI5. FLJ20967 (Accession NM\_022071) is another VGAM481 host target gene. FLJ20967 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20967, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20967 BINDING SITE, designated SEQ ID:22615, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22104] Another function of VGAM481 is therefore inhibition of FLJ20967 (Accession NM\_022071). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20967. FLJ31978 (Accession NM\_144669) is another VGAM481 host target gene. FLJ31978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31978 BINDING SITE, designated SEQ ID:29489, to the nucleotide sequence of

VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22105] Another function of VGAM481 is therefore inhibition of FLJ31978 (Accession NM\_144669). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31978. KIAA0960 (Accession XM\_166543) is another VGAM481 host target gene. KIAA0960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:44518, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22106] Another function of VGAM481 is therefore inhibition of KIAA0960 (Accession XM\_166543). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0960. MGC35521 (Accession NM\_145065) is another VGAM481 host target gene. MGC35521 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC35521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35521 BINDING SITE, designated SEQ ID:29703, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22107] Another function of VGAM481 is therefore inhibition of MGC35521 (Accession NM\_145065). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35521. RASD Family, Member 2 (RASD2, Accession NM\_014310) is another VGAM481 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15606, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22108] Another function of VGAM481 is therefore inhibition of

RASD Family, Member 2 (RASD2, Accession NM\_014310). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. LOC126432 (Accession XM\_059046) is another VGAM481 host target gene. LOC126432 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126432 BINDING SITE, designated SEQ ID:36841, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22109] Another function of VGAM481 is therefore inhibition of LOC126432 (Accession XM\_059046). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126432. LOC144866 (Accession XM\_096699) is another VGAM481 host target gene. LOC144866 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144866, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144866 BINDING SITE, designated SEQ ID:40475, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22110] Another function of VGAM481 is therefore inhibition of LOC144866 (Accession XM\_096699). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144866. LOC146316 (Accession XM\_027568) is another VGAM481 host target gene. LOC146316 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146316 BINDING SITE, designated SEQ ID:30525, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22111] Another function of VGAM481 is therefore inhibition of LOC146316 (Accession XM\_027568). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146316. LOC150481 (Accession XM\_086929) is another VGAM481 host target gene. LOC150481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150481 BINDING SITE, designated SEQ ID:38981, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22112] Another function of VGAM481 is therefore inhibition of LOC150481 (Accession XM\_086929). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150481. LOC64744 (Accession XM\_029830) is another VGAM481 host target gene. LOC64744 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC64744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64744 BINDING SITE, designated SEQ ID:30951, to the nucleotide sequence of VGAM481 RNA, herein designated

VGAM RNA, also designated SEQ ID:3192.

[22113] Another function of VGAM481 is therefore inhibition of LOC64744 (Accession XM\_029830). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64744. LOC91266 (Accession XM\_037268) is another VGAM481 host target gene. LOC91266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:32602, to the nucleotide sequence of VGAM481 RNA, herein designated VGAM RNA, also designated SEQ ID:3192.

[22114] Another function of VGAM481 is therefore inhibition of LOC91266 (Accession XM\_037268). Accordingly, utilities of VGAM481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 482 (VGAM482) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22115] VGAM482 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM482 was detected is described hereinabove with reference to Figs. 1–8.

[22116] VGAM482 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22117] VGAM482 gene encodes a VGAM482 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM482 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM482 precursor RNA is designated SEQ ID:468, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:468 is located at position 2953 relative to the genome of Hepatitis G Virus.

[22118] VGAM482 precursor RNA folds onto itself, forming

VGAM482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22119] An enzyme complex designated DICER COMPLEX, `dices` the VGAM482 folded precursor RNA into VGAM482 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM482 RNA is designated SEQ ID:3193, and is provided hereinbelow with reference to the sequence listing part.

[22120] VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM482 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22121] VGAM482 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM482 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM482 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22122] The complementary binding of VGAM482 RNA, herein designated VGAM RNA, to host target binding sites on VGAM482 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM482 host target RNA into VGAM482 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22123] It is appreciated that VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM482 host target genes. The mRNA of each one of this plurality of VGAM482 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM482 RNA, herein designated VGAM RNA, and which when bound by VGAM482 RNA causes inhibition of translation of respective one or more VGAM482 host target proteins.

[22124] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM482 gene, herein designated VGAM GENE, on one or more VGAM482 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22125] It is yet further appreciated that a function of VGAM482 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM482 correlate with, and may be deduced from, the identity of the host target genes which VGAM482 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[22126] Nucleotide sequences of the VGAM482 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM482 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM482 are further described hereinbelow with reference to Table 1.

[22127] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM482 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM482 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22128] As mentioned hereinabove with reference to Fig. 1, a function of VGAM482 gene, herein designated VGAM is inhibition of expression of VGAM482 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM482 correlate with, and may be deduced from, the identity of the target genes which VGAM482 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[22129] Chromosome 1 Open Reading Frame 1 (C1orf1, Accession NM\_001213) is a VGAM482 host target gene. C1orf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf1 BINDING SITE, designated SEQ ID:6874, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22130] A function of VGAM482 is therefore inhibition of Chromosome 1 Open Reading Frame 1 (C1orf1, Accession NM\_001213). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf1. CSE1 Chromosome Segregation 1-like (yeast) (CSE1L, Accession XM\_030044) is another VGAM482 host target gene. CSE1L BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CSE1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CSE1L BINDING SITE, designated SEQ ID:30990, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22131] Another function of VGAM482 is therefore inhibition of CSE1 Chromosome Segregation 1-like (yeast) (CSE1L, Accession XM\_030044). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE1L. Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009) is another VGAM482 host target gene. GJB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB3 BINDING SITE, designated SEQ ID:23441, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22132] Another function of VGAM482 is therefore inhibition of Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB3. Protein Ki-

nase, Lysine Deficient 3 (PRKWNK3, Accession XM\_029183) is another VGAM482 host target gene. PRKWNK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKWNK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWNK3 BINDING SITE, designated SEQ ID:30855, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22133] Another function of VGAM482 is therefore inhibition of Protein Kinase, Lysine Deficient 3 (PRKWNK3, Accession XM\_029183). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK3. RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799) is another VGAM482 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

RNMT BINDING SITE, designated SEQ ID:9878, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22134] Another function of VGAM482 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Chromosome 20 Open Reading Frame 126 (C20orf126, Accession NM\_030815) is another VGAM482 host target gene. C20orf126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf126 BINDING SITE, designated SEQ ID:25134, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22135] Another function of VGAM482 is therefore inhibition of Chromosome 20 Open Reading Frame 126 (C20orf126, Accession NM\_030815). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf126.

FLJ12987 (Accession NM\_025170) is another VGAM482 host target gene. FLJ12987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12987 BINDING SITE, designated SEQ ID:24807, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22136] Another function of VGAM482 is therefore inhibition of FLJ12987 (Accession NM\_025170). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12987. PR Domain Containing 8 (PRDM8, Accession NM\_020226) is another VGAM482 host target gene. PRDM8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRDM8, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM8 BINDING SITE, designated SEQ ID:21490, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22137] Another function of VGAM482 is therefore inhibition of PR Domain Containing 8 (PRDM8, Accession NM\_020226). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM8. Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966) is another VGAM482 host target gene. SEMA5A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA5A BINDING SITE, designated SEQ ID:10103, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22138] Another function of VGAM482 is therefore inhibition of Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM\_003966). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA5A. TU12B1-TY (Accession NM\_016575) is another VGAM482 host target gene. TU12B1-TY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU12B1-TY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:18644, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22139] Another function of VGAM482 is therefore inhibition of TU12B1-TY (Accession NM\_016575). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY. LOC167040 (Accession XM\_106497) is another VGAM482 host target gene. LOC167040 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC167040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC167040 BINDING SITE, designated SEQ ID:42202, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22140] Another function of VGAM482 is therefore inhibition of LOC167040 (Accession XM\_106497). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC167040. LOC91050 (Accession XM\_035703) is another VGAM482 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32340, to the nucleotide sequence of VGAM482 RNA, herein designated VGAM RNA, also designated SEQ ID:3193.

[22141] Another function of VGAM482 is therefore inhibition of

LOC91050 (Accession XM\_035703). Accordingly, utilities of VGAM482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 483 (VGAM483) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22142] VGAM483 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM483 was detected is described hereinabove with reference to Figs. 1–8.

[22143] VGAM483 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22144] VGAM483 gene encodes a VGAM483 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM483 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM483 precursor RNA is designated SEQ ID:469, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:469 is located at position 4804 relative to the genome of Hepatitis G Virus.

[22145] VGAM483 precursor RNA folds onto itself, forming VGAM483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22146] An enzyme complex designated DICER COMPLEX, `dices` the VGAM483 folded precursor RNA into VGAM483 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide se-

quence of VGAM483 RNA is designated SEQ ID:3194, and is provided hereinbelow with reference to the sequence listing part.

[22147] VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM483 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[22148] VGAM483 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM483 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM483 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22149] The complementary binding of VGAM483 RNA, herein designated VGAM RNA, to host target binding sites on VGAM483 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM483 host target RNA into VGAM483 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22150] It is appreciated that VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM483 host target genes. The mRNA of each one of this plurality of VGAM483 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM483 RNA, herein designated VGAM RNA, and which when bound by VGAM483 RNA causes inhibition of translation of respective one or more VGAM483 host target proteins.

[22151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM483 gene, herein designated VGAM GENE, on one or more VGAM483 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22152] It is yet further appreciated that a function of VGAM483 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM483 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM483 correlate with, and may be deduced from, the identity of the host target genes which VGAM483 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22153] Nucleotide sequences of the VGAM483 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM483 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM483 are further described hereinbelow with reference to Table 1.

[22154] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM483 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM483 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22155] As mentioned hereinabove with reference to Fig. 1, a function of VGAM483 gene, herein designated VGAM is inhibition of expression of VGAM483 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM483 correlate with, and may be deduced from, the identity of the target genes which VGAM483 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22156] N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM\_172983) is a VGAM483 host target gene. NAPG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NAPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPG BINDING SITE, designated SEQ ID:46249, to the nucleotide sequence of VGAM483 RNA, herein designated VGAM RNA, also designated SEQ ID:3194.

[22157] A function of VGAM483 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM\_172983). Accordingly, utilities of VGAM483 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with NAPG. LOC196955 (Accession XM\_085210) is another VGAM483 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37925, to the nucleotide sequence of VGAM483 RNA, herein designated VGAM RNA, also designated SEQ ID:3194.

[22158] Another function of VGAM483 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 484 (VGAM484) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22159] VGAM484 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM484 was detected is described hereinabove with reference to Figs. 1–8.

[22160] VGAM484 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus.

VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22161] VGAM484 gene encodes a VGAM484 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM484 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM484 precursor RNA is designated SEQ ID:470, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:470 is located at position 6210 relative to the genome of Hepatitis G Virus.

[22162] VGAM484 precursor RNA folds onto itself, forming VGAM484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22163] An enzyme complex designated DICER COMPLEX, `dices` the VGAM484 folded precursor RNA into VGAM484 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM484 RNA is designated SEQ ID:3195, and is provided hereinbelow with reference to the sequence listing part.

[22164] VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM484 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22165] VGAM484 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM484 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM484 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22166] The complementary binding of VGAM484 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM484 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM484 host target RNA into VGAM484 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22167] It is appreciated that VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM484 host target genes. The mRNA of each one of this plurality of VGAM484 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM484 RNA, herein designated VGAM RNA, and which when bound by VGAM484 RNA causes inhibition of translation of respective one or more VGAM484 host target proteins.

[22168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM484 gene, herein designated VGAM GENE, on one or more VGAM484 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22169] It is yet further appreciated that a function of VGAM484 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM484 correlate with, and may be deduced from, the identity of the host target genes which VGAM484 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22170] Nucleotide sequences of the VGAM484 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM484 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM484 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM484 are further described hereinbelow with reference to Table 1.

[22171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM484 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM484 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22172] As mentioned hereinabove with reference to Fig. 1, a function of VGAM484 gene, herein designated VGAM is inhibition of expression of VGAM484 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM484 correlate with, and may be deduced from, the identity of the target genes which VGAM484 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22173] Complement Component 5 Receptor 1 (C5a ligand) (C5R1, Accession NM\_001736) is a VGAM484 host target gene. C5R1 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by C5R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5R1 BINDING SITE, designated SEQ ID:7473, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22174] A function of VGAM484 is therefore inhibition of Complement Component 5 Receptor 1 (C5a ligand) (C5R1, Accession NM\_001736), a gene which has a nonredundant function and is required for mucosal host cell defense in the lung. Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5R1. The function of C5R1 has been established by previous studies. Using a panel of somatic cell hybrids, Bao et al. (1992) mapped the receptor for the chemotactic ligand C5a to chromosome 19. This receptor, like those for the formyl peptides (136537, 136538) and interleukin-8 (OMIM Ref. No. 146929), is structurally related to rhodopsin (RHO; 180380) and transduces signals via intracellular GTP-binding proteins. Additionally, this receptor is similar to chemokine receptor-like 1 (OMIM Ref. No. 601531). Hopken et al. (1996)

deleted the murine C5a receptor (C5ar) through homologous recombination. They reported that the C5ar-deficient mice showed no developmental or biologic defects in cells in which C5a is expressed (e.g., myeloid cell lineages, hepatocytes, and epithelial cells) apart from the ability to bind and signal to exogenous C5a. Hopken et al. (1996) reported that C5ar-deficient mice bred normally and displayed no gross defects when maintained under barrier conditions. When mice were challenged with intratracheal *Pseudomonas aeruginosa*, the C5ar-deficient mice, in contrast to their littermates, were unable to clear the bacteria and they succumbed to pneumonia. On the basis of these studies, Hopken et al. (1996) concluded that C5ar has a nonredundant function and is required for mucosal host cell defense in the lung.

[22175] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22176] Hopken, U. E.; Lu, D.; Gerard, N. P.; Gerard, C. : The C5a chemoattractant receptor mediates mucosal defense to infection. *Nature* 383: 86–89, 1996. ; and

[22177] Bao, L.; Gerard, N. P.; Eddy, R. L., Jr.; Shows, T. B.; Gerard, C. : Mapping of genes for the human C5a receptor (C5AR),

human FMLP receptor (FPR), and two FMLP receptor homologue orphan.

[22178] Further studies establishing the function and utilities of C5R1 are found in John Hopkins OMIM database record ID 113995, and in cited publications numbered 2131, 3731–3732, 4555–373 and 4225 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytoplasmic Linker 2 (CYLN2, Accession NM\_003388) is another VGAM484 host target gene. CYLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLN2 BINDING SITE, designated SEQ ID:9423, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22179] Another function of VGAM484 is therefore inhibition of Cytoplasmic Linker 2 (CYLN2, Accession NM\_003388), a gene which associates with microtubules and dendritic lamellar bodies. Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CYLN2. The function of CYLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM94.DXS1283E (Accession XM\_047871) is another VGAM484 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35065, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22180] Another function of VGAM484 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. Ribonuclease/angiogenin Inhibitor (RNH, Accession NM\_002939) is another VGAM484 host target gene. RNH BINDING SITE1 and RNH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RNH, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNH BINDING SITE1 and RNH BINDING SITE2, designated SEQ ID:8845 and SEQ ID:29994 respectively, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22181] Another function of VGAM484 is therefore inhibition of Ribonuclease/angiogenin Inhibitor (RNH, Accession NM\_002939), a gene which is an inhibitor of pancreatic rnaase and angiogenin. may also function in the modulation of cellular activities. Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNH. The function of RNH has been established by previous studies. Placental ribonuclease inhibitor is a member of a family of proteinaceous cytoplasmic RNase inhibitors that occur in many tissues and bind to both intracellular and extracellular RNases. In addition to control of intracellular RNases, the inhibitor may have a role in the regulation of angiogenin (OMIM Ref. No. 105850). Ribonuclease inhibitor, of 50,000 Da, binds to ribonucleases and holds them in a latent form. Since neutral and alkaline ribonucleases proba-

bly play a critical role in the turnover of RNA in eukaryotic cells, RNH may be essential for control of mRNA turnover; the interaction of eukaryotic cells with ribonuclease may be reversible in vivo. Lee et al. (1988) determined the primary structure of PRI from the cDNA. The mature protein encodes a 460-amino acid polypeptide with a molecular mass of 49,847 kD. The amino acid sequence contains 7 direct internal repeat units, each 57 amino acids in length. These repeat units comprise 87% of the molecule. The average degree of identity between any 2 is 39%. By study of human-rodent somatic cell hybrids and by in situ hybridization, Weremowicz et al. (1990) mapped the PRI gene to 11p15. The localization was further refined to 11p15.5, distal to the IGF2 gene, by in situ hybridization to metaphase chromosomes from a cell line with a well-characterized translocation involving a breakpoint between IGF2 (OMIM Ref. No. 147470) and HRAS (OMIM Ref. No. 190020). Zneimer et al. (1990) localized the RNH gene to 11p15.5 by in situ hybridization

[22182] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22183] Weremowicz, S.; Fox, E. A.; Morton, C. C.; Vallee, B. L. :

The placental ribonuclease inhibitor (RNH) gene is located on chromosome subband 11p15.5. Genomics 8: 717–721, 1990. ; and

[22184] Zneimer, S. M.; Crawford, D.; Schneider, N. R.; Beutler, B. : Mapping of the human ribonuclease inhibitor gene (RNH) to chromosome 11p15 by in situ hybridization. Genomics 8: 175–178, 19.

[22185] Further studies establishing the function and utilities of RNH are found in John Hopkins OMIM database record ID 173320, and in cited publications numbered 9830–9832 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EDR2 (Accession XM\_018136) is another VGAM484 host target gene. EDR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDR2 BINDING SITE, designated SEQ ID:30337, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22186] Another function of VGAM484 is therefore inhibition of EDR2 (Accession XM\_018136). Accordingly, utilities of

VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR2.

FLJ14800 (Accession NM\_032840) is another VGAM484 host target gene. FLJ14800 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14800 BINDING SITE, designated SEQ ID:26621, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22187] Another function of VGAM484 is therefore inhibition of FLJ14800 (Accession NM\_032840). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14800. FLJ23342 (Accession NM\_024631) is another VGAM484 host target gene. FLJ23342 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23342 BINDING SITE,

designated SEQ ID:23897, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22188] Another function of VGAM484 is therefore inhibition of FLJ23342 (Accession NM\_024631). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23342. FLJ23519 (Accession NM\_032240) is another VGAM484 host target gene. FLJ23519 BINDING SITE1 and FLJ23519 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ23519, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE1 and FLJ23519 BINDING SITE2, designated SEQ ID:25975 and SEQ ID:34308 respectively, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22189] Another function of VGAM484 is therefore inhibition of FLJ23519 (Accession NM\_032240). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. KIAA0607 (Accession XM\_051931) is another VGAM484

host target gene. KIAA0607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0607 BINDING SITE, designated SEQ ID:35925, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22190] Another function of VGAM484 is therefore inhibition of KIAA0607 (Accession XM\_051931). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0607. KIAA0674 (Accession XM\_027054) is another VGAM484 host target gene. KIAA0674 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0674 BINDING SITE, designated SEQ ID:30398, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22191] Another function of VGAM484 is therefore inhibition of KIAA0674 (Accession XM\_027054). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0674. KIAA1473 (Accession XM\_047550) is another VGAM484 host target gene. KIAA1473 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1473 BINDING SITE, designated SEQ ID:34996, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22192] Another function of VGAM484 is therefore inhibition of KIAA1473 (Accession XM\_047550). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1473. P450RAI-2 (Accession NM\_019885) is another VGAM484 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:21267, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22193] Another function of VGAM484 is therefore inhibition of P450RAI-2 (Accession NM\_019885). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. LOC112868 (Accession XM\_053402) is another VGAM484 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36078, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22194] Another function of VGAM484 is therefore inhibition of LOC112868 (Accession XM\_053402). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC112868. LOC51644 (Accession NM\_016057) is another VGAM484 host target gene. LOC51644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51644 BINDING SITE, designated SEQ ID:18131, to the nucleotide sequence of VGAM484 RNA, herein designated VGAM RNA, also designated SEQ ID:3195.

[22195] Another function of VGAM484 is therefore inhibition of LOC51644 (Accession NM\_016057). Accordingly, utilities of VGAM484 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51644. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 485 (VGAM485) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22196] VGAM485 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM485 was detected is described hereinabove with reference to Figs. 1–8.

[22197] VGAM485 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus.

VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22198] VGAM485 gene encodes a VGAM485 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM485 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM485 precursor RNA is designated SEQ ID:471, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:471 is located at position 1462 relative to the genome of Hepatitis G Virus.

[22199] VGAM485 precursor RNA folds onto itself, forming VGAM485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22200] An enzyme complex designated DICER COMPLEX, `dices` the VGAM485 folded precursor RNA into VGAM485 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM485 RNA is designated SEQ ID:3196, and is provided hereinbelow with reference to the sequence listing part.

[22201] VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM485 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22202] VGAM485 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM485 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM485 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22203] The complementary binding of VGAM485 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM485 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM485 host target RNA into VGAM485 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22204] It is appreciated that VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM485 host target genes. The mRNA of each one of this plurality of VGAM485 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM485 RNA, herein designated VGAM RNA, and which when bound by VGAM485 RNA causes inhibition of translation of respective one or more VGAM485 host target proteins.

[22205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM485 gene, herein designated VGAM GENE, on one or more VGAM485 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22206] It is yet further appreciated that a function of VGAM485 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM485 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM485 correlate with, and may be deduced from, the identity of the host target genes which VGAM485 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22207] Nucleotide sequences of the VGAM485 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM485 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM485 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM485 are further described hereinbelow with reference to Table 1.

[22208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM485 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM485 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22209] As mentioned hereinabove with reference to Fig. 1, a function of VGAM485 gene, herein designated VGAM is inhibition of expression of VGAM485 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM485 correlate with, and may be deduced from, the identity of the target genes which VGAM485 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22210] LOC200014 (Accession XM\_114087) is a VGAM485 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42695, to the nucleotide sequence of VGAM485 RNA, herein designated VGAM RNA, also designated SEQ ID:3196.

[22211] A function of VGAM485 is therefore inhibition of LOC200014 (Accession XM\_114087). Accordingly, utilities of VGAM485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 486 (VGAM486) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22212] VGAM486 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM486 was detected is described hereinabove with reference to Figs. 1–8.

[22213] VGAM486 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus.

VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22214] VGAM486 gene encodes a VGAM486 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM486 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM486 precursor RNA is designated SEQ ID:472, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:472 is located at position 5080 relative to the genome of Hepatitis G Virus.

[22215] VGAM486 precursor RNA folds onto itself, forming VGAM486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22216] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM486 folded precursor RNA into VGAM486 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM486 RNA is designated SEQ ID:3197, and is provided hereinbelow with reference to the sequence listing part.

[22217] VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM486 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22218] VGAM486 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM486 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM486 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22219] The complementary binding of VGAM486 RNA, herein designated VGAM RNA, to host target binding sites on VGAM486 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM486 host target RNA into VGAM486 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22220] It is appreciated that VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM486 host target genes. The mRNA of each one of this plurality of VGAM486 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM486 RNA, herein designated VGAM RNA, and which when bound by VGAM486 RNA causes inhibition of translation of respective one or more VGAM486 host target proteins.

[22221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM486 gene, herein designated VGAM GENE, on one or more VGAM486 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22222] It is yet further appreciated that a function of VGAM486 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM486 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM486 correlate with, and may be deduced from, the identity of the host target genes which VGAM486 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22223] Nucleotide sequences of the VGAM486 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM486 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM486 are further described hereinbelow with reference to Table 1.

[22224] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM486 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM486 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22225] As mentioned hereinabove with reference to Fig. 1, a function of VGAM486 gene, herein designated VGAM is inhibition of expression of VGAM486 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM486 correlate with, and may be deduced from, the identity of the target genes which VGAM486 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22226] Beta-site APP-cleaving Enzyme 2 (BACE2, Accession NM\_138992) is a VGAM486 host target gene. BACE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE2 BINDING SITE, designated SEQ ID:29092, to the

nucleotide sequence of VGAM486 RNA, herein designated VGAM RNA, also designated SEQ ID:3197.

[22227] A function of VGAM486 is therefore inhibition of Beta-site APP-cleaving Enzyme 2 (BACE2, Accession NM\_138992), a gene which cleaves intracellularly the b-secretase site of amyloid precursor protein. Accordingly, utilities of VGAM486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE2. The function of BACE2 has been established by previous studies. Deposition in the brain of the 39- to 43-amino acid amyloid-beta peptide is a hallmark of Alzheimer disease (AD; 104300), a frequent complication of Down syndrome (OMIM Ref. No. 190685) patients after age 30 years. Amyloid-beta is generated by proteolytic processing of the amyloid precursor protein (APP; 104760) by beta- and gamma-secretase at the N and C termini, respectively. Presenilin-1 (OMIM Ref. No. 104311) is involved in the gamma-secretase activity. BACE (OMIM Ref. No. 604252), a transmembrane aspartyl protease, possesses beta-secretase activity. By differential display RT-PCR of poorly and highly metastatic breast cancer cell lines, followed by screening a bone marrow stroma cell cDNA library, Xin et al. (2000) obtained a cDNA encoding

BACE2, which they termed ALP56. Sequence analysis predicted that the 518-amino acid protein has 2 pepsin-like active centers, a signal sequence, a propeptide, and a long C-terminal extension including a transmembrane domain. Northern blot analysis detected 2.5- and 2.0-kb transcripts in metastatic tumors injected in SCID mice (see OMIM Ref. No. 202500). In situ hybridization analysis demonstrated high expression in breast, colon, and prostate cancer biopsies, as well as in normal prostate. Northern blot analysis of normal tissue revealed expression in prostate, pancreas, and placenta. Further exposure detected expression in all tissues tested except brain and lymphocytes. Western blot analysis showed expression of a 60-kD protein as well as apparent autocleavage products of 17 and 14 kD. By searching EST databases with the BACE sequence and identifying mapped sequences, Saunders et al. (1999) identified a cDNA encoding BACE2 and mapped the gene to 21q22.2-q22.3. Using FISH, Acquati et al. (2000) confirmed the localization of BACE2 to 21q22.3, within the Down syndrome critical region.

[22228] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [22229] Xin, H.; Stephans, J. C.; Duan, X.; Harrowe, G.; Kim, E.; Grieshammer, U.; Kingsley, C.; Giese, K. : Identification of a novel aspartic-like protease differentially expressed in human breast cancer cell lines. *Biochim. Biophys. Acta* 1501: 125–137, 2000. ; and
- [22230] Saunders, A. J.; Kim, T.-W.; Tanzi, R. E. : BACE maps to chromosome 11 and a BACE homolog, BACE2, reside in the obligate Down syndrome region of chromosome 21. *Science* 286: 1255A only.
- [22231] Further studies establishing the function and utilities of BACE2 are found in John Hopkins OMIM database record ID 605668, and in cited publications numbered 641 and 6416–6419 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC254314 (Accession XM\_172871) is another VGAM486 host target gene. LOC254314 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254314 BINDING SITE, designated SEQ ID:46150, to the nucleotide sequence of VGAM486 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3197.

[22232] Another function of VGAM486 is therefore inhibition of LOC254314 (Accession XM\_172871). Accordingly, utilities of VGAM486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254314. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 487 (VGAM487) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22233] VGAM487 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM487 was detected is described hereinabove with reference to Figs. 1–8.

[22234] VGAM487 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM487 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22235] VGAM487 gene encodes a VGAM487 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM487 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM487 precursor RNA is designated SEQ ID:473, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:473 is located at position 9016 relative to the genome of Hepatitis G Virus.

[22236] VGAM487 precursor RNA folds onto itself, forming VGAM487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22237] An enzyme complex designated DICER COMPLEX, `dices` the VGAM487 folded precursor RNA into VGAM487 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM487 RNA is designated SEQ ID:3198, and is provided hereinbelow with reference to the sequence listing part.

[22238] VGAM487 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM487 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[22239] VGAM487 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM487 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM487 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22240] The complementary binding of VGAM487 RNA, herein designated VGAM RNA, to host target binding sites on VGAM487 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM487 host target RNA into VGAM487 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22241] It is appreciated that VGAM487 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM487 host target genes. The mRNA of

each one of this plurality of VGAM487 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM487 RNA, herein designated VGAM RNA, and which when bound by VGAM487 RNA causes inhibition of translation of respective one or more VGAM487 host target proteins.

[22242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM487 gene, herein designated VGAM GENE, on one or more VGAM487 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[22243] It is yet further appreciated that a function of VGAM487 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM487 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM487 correlate with, and may be deduced from, the identity of the host target genes which VGAM487 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22244] Nucleotide sequences of the VGAM487 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM487 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM487 are further described hereinbelow with reference to Table 1.

[22245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM487 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM487 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[22246] As mentioned hereinabove with reference to Fig. 1, a function of VGAM487 gene, herein designated VGAM is inhibition of expression of VGAM487 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM487 correlate with, and may be deduced from, the identity of the target genes which VGAM487 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22247] Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM\_000874) is a VGAM487 host target gene. IFNAR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IFNAR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNAR2 BINDING SITE, designated SEQ ID:6554, to the nucleotide sequence of VGAM487 RNA, herein designated VGAM RNA, also designated SEQ ID:3198.

[22248] A function of VGAM487 is therefore inhibition of Interferon (alpha, beta and omega) Receptor 2 (IFNAR2, Accession NM\_000874), a gene which is a receptor for interfer-

ons alpha and beta. Accordingly, utilities of VGAM487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNAR2. The function of IFNAR2 has been established by previous studies. Alpha-type antiviral protein is a factor, presumably protein in nature, that mediates specific interferon inhibition of virus replication. According to studies of mouse-man hybrid clones, the locus determining this protein is carried on chromosome 21 (Tan et al., 1973). Tan et al. (1974) made observations of dosage effect in monosomy-21 and trisomy-21 cells which supported assignment of the locus to chromosome 21. This character was also called interferon sensitivity (IS). Chany et al. (1975) showed that trisomy-21 cells have increased interferon sensitivity. Trisomy-16 cells have reduced sensitivity. This might suggest the presence on chromosome 16 of a regulator of mouse antiviral protein. Reve et al. (1976) showed that antibody to a cell surface component coded by human chromosome 21 inhibited the action of interferon. This suggested that antiviral protein is an interferon receptor. See 147570, 147640, 147660 for a discussion of the gamma, beta, and alpha interferons, respectively. De Clercq et al. (1976) concluded that it is not a cell mem-

brane receptor for interferon that is encoded by chromosome 21 Raziuddin et al. (1984) showed that the receptors for alpha- and beta-interferons are specified by chromosome 21. It was presumed that separate genes encoded the alpha- and beta-interferon receptors. Novick et al. (1994) described a universal ligand-binding receptor for human interferons alpha and interferon beta. Sarkar and Gupta (1984) showed that gamma-interferon binds to a separate receptor that is carried by WISH cells (a human amnion cell line). The gene for the receptor was designated also IFNAR. Langer et al. (1990) sublocalized the IFNAR gene to 21q22.1-q22.2 by hybridization of (32)P-labeled recombinant interferon-alpha/beta receptor with human-hamster somatic cell hybrids containing various fragments of human chromosome 21. By in situ hybridization, Lutfalla et al. (1990) refined the assignment to 21q22.1. Lutfalla et al. (1992) further refined the localization by pulsed field gel electrophoresis and its linkage to adjacent markers. They compared the exon structure of the IFNAR gene with that of the genes for receptors of the cytokine/growth hormone/prolactin/interferon receptor family and concluded that they have a common origin and have diverged from the immunoglobulin superfamily with

which they share a common ancestor. Cellular responses to cytokines involve cross-communication through their respective receptors. The IFNs alpha, beta, and gamma mediate innate immune responses to viral infection through IFNAR1/IFNAR2 (OMIM Ref. No. 602376) for IFNA and IFNB, and IFNGR1 (OMIM Ref. No. 107470)/IFNGR2 (OMIM Ref. No. 147569) for IFNG. Stimulation of these receptors activates Janus protein kinases (e.g., JAK1, 147795 and JAK2, 147796), which leads to the tyrosine phosphorylation of STAT1 (OMIM Ref. No. 600555) and STAT2 (OMIM Ref. No. 600556). Although the IFN receptors are expressed at low levels in cells, they may be clustered in the cell membrane to permit efficient signal transduction. Using mouse embryonic fibroblasts (MEFs) from IFNAR1- and IFNGR1-deficient mice, Takaoka et al. (2000) observed that the STAT1-mediated DNA-binding activity and the antiviral response to IFNG in IFNAR-null MEFs but not to IFNA in IFNGR-null MEFs are impaired. Restoration of the IFNG response requires constitutive subthreshold IFNA/IFNB signaling and an intact IFNAR1 capable of interacting with STAT1 after tyrosine phosphorylation. Immunoblot analysis showed that IFNAR1 coimmunoprecipitated with the nonligand-binding component,

IFNGR2, of the IFNGR complex in wildtype MEFs but less well in IFNB-null MEFs. Immunoblot analysis also demonstrated that the IFN receptor components are exclusively localized in the caveolar membrane fractions (see OMIM Ref. No. CAV1; 601047) where there is a concentration of cytoplasmically oriented signaling molecules.

[22249] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22250] Takaoka, A.; Mitani, Y.; Suemori, H.; Sato, M.; Yokochi, T.; Noguchi, S.; Tanaka, N.; Taniguchi, T. : Cross talk between interferon-gamma and -alpha/beta signaling components in caveolar membrane domains. Science 288: 2357-2360, 2000. ; and

[22251] Novick, D.; Cohen, B.; Rubinstein, M. : The human interferon alpha/beta receptor: characterization and molecular cloning. Cell 77: 391-400, 1994.

[22252] Further studies establishing the function and utilities of IFNAR2 are found in John Hopkins OMIM database record ID 602376, and in cited publications numbered 5597-5599, 560 and 11830-5601 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ14621 (Accession NM\_032811) is

another VGAM487 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26578, to the nucleotide sequence of VGAM487 RNA, herein designated VGAM RNA, also designated SEQ ID:3198.

[22253] Another function of VGAM487 is therefore inhibition of FLJ14621 (Accession NM\_032811). Accordingly, utilities of VGAM487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. FLJ22169 (Accession NM\_024085) is another VGAM487 host target gene. FLJ22169 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23521, to the nucleotide sequence of VGAM487 RNA, herein designated VGAM RNA, also designated SEQ ID:3198.

[22254] Another function of VGAM487 is therefore inhibition of FLJ22169 (Accession NM\_024085). Accordingly, utilities of VGAM487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169. RBAK (Accession NM\_021163) is another VGAM487 host target gene. RBAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBAK BINDING SITE, designated SEQ ID:22140, to the nucleotide sequence of VGAM487 RNA, herein designated VGAM RNA, also designated SEQ ID:3198.

[22255] Another function of VGAM487 is therefore inhibition of RBAK (Accession NM\_021163). Accordingly, utilities of VGAM487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBAK. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 488 (VGAM488) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[22256] VGAM488 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM488 was detected is described hereinabove with reference to Figs. 1–8.

[22257] VGAM488 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM488 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22258] VGAM488 gene encodes a VGAM488 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM488 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM488 precursor RNA is designated SEQ ID:474, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:474 is located at position 2231 relative to the genome of Hepatitis G Virus.

[22259] VGAM488 precursor RNA folds onto itself, forming VGAM488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[22260] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM488 folded precursor RNA into VGAM488 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 45%) nucleotide se-  
quence of VGAM488 RNA is designated SEQ ID:3199, and  
is provided hereinbelow with reference to the sequence  
listing part.

[22261] VGAM488 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM488 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM488 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[22262] VGAM488 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM488 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM488 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[22263] The complementary binding of VGAM488 RNA, herein designated VGAM RNA, to host target binding sites on VGAM488 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM488 host target RNA into VGAM488 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22264] It is appreciated that VGAM488 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM488 host target genes. The mRNA of each one of this plurality of VGAM488 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM488 RNA, herein designated VGAM RNA, and which when bound by VGAM488 RNA causes inhibition of translation of respective one or more VGAM488 host target proteins.

[22265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM488 gene, herein designated VGAM GENE, on one or

more VGAM488 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22266] It is yet further appreciated that a function of VGAM488 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM488 correlate with, and may be deduced from, the identity of the host target genes which VGAM488 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22267] Nucleotide sequences of the VGAM488 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM488 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM488 are further described hereinbelow with reference to Table 1.

[22268] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM488 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM488 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22269] As mentioned hereinabove with reference to Fig. 1, a function of VGAM488 gene, herein designated VGAM is inhibition of expression of VGAM488 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM488 correlate with, and may be deduced from, the identity of the target genes which VGAM488 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22270] Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Acces-

sion NM\_052988) is a VGAM488 host target gene. CDK10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK10 BINDING SITE, designated SEQ ID:27558, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22271] A function of VGAM488 is therefore inhibition of Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM\_052988), a gene which plays a pivotal role in the regulation of the eukaryotic cell cycle. Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK10. The function of CDK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Cytokine Inducible SH2-containing Protein (CISH, Accession NM\_145071) is another VGAM488 host target gene. CISH BINDING SITE1 and CISH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CISH, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CISH BINDING SITE1 and CISH BINDING SITE2, designated SEQ ID:29705 and SEQ ID:14972 respectively, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22272] Another function of VGAM488 is therefore inhibition of Cytokine Inducible SH2-containing Protein (CISH, Accession NM\_145071), a gene which intervenes in the negative regulation of cytokines. Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CISH. The function of CISH has been established by previous studies. As part of the search for immediate-early cytokine-responsive genes, Yoshimura et al. (1995) cloned murine Cish, which was shown to have a growth inhibitory function. Cis, the protein product of Cish, has a Src homology 2 (SH2) domain in the middle of its sole structural motif. Tight linkage of Cish to the Gnai2 gene (OMIM Ref. No. 139360) on mouse chromosome 9, a region syntenic to human 3p21, prompted Uchida et al. (1997) to isolate a human CISH cDNA and map the gene to 3p21.3 by fluorescence in situ

hybridization. Northern blot analysis showed expression of CISH as a 2-kb transcript in various epithelial tissues, including lung and kidney, which develop tumors frequently exhibiting 3p21.3 deletions. The CISH gene contains 2 introns, about 3 kb and 0.4 kb in size, and has 3 repeats of the pentameric mRNA destabilization signal, ATTTA, in its 3-prime untranslated region. The CIS protein consists of 258 amino acids.

[22273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22274] Uchida, K.; Yoshimura, A.; Inazawa, J.; Yanagisawa, K.; Osada, H.; Masuda, A.; Saito, T.; Takahashi, T.; Miyajima, A.; Takahashi, T. : Molecular cloning of CISH, chromosome assignment to 3p21.3, and analysis of expression in fetal and adult tissues. *Cytogenet. Cell Genet.* 78: 209–212, 1997. ; and

[22275] Yoshimura, A.; Ohkubo, T.; Kiguchi, T.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Hara, T.; Miyajima, A. : A novel cytokine-inducible gene CIS, encodes an SH2-containing protein.

[22276] Further studies establishing the function and utilities of CISH are found in John Hopkins OMIM database record ID

602441, and in cited publications numbered 5610–5611 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MHC Class II Transactivator (MHC2TA, Accession NM\_000246) is another VGAM488 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:5780, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22277] Another function of VGAM488 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM\_000246). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM\_006235) is another VGAM488 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12891, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22278] Another function of VGAM488 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM\_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM171.Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063) is another VGAM488 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SCD BINDING SITE, designated SEQ ID:11497, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22279] Another function of VGAM488 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314.Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM\_005629) is another VGAM488 host target gene. SLC6A8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:12151, to the nucleotide sequence of VGAM488 RNA,

herein designated VGAM RNA, also designated SEQ ID:3199.

[22280] Another function of VGAM488 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM\_005629). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169) is another VGAM488 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18253, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22281] Another function of VGAM488 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. Dynactin 4 (p62)

(DCTN4, Accession XM\_041993) is another VGAM488 host target gene. DCTN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCTN4 BINDING SITE, designated SEQ ID:33667, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22282] Another function of VGAM488 is therefore inhibition of Dynactin 4 (p62) (DCTN4, Accession XM\_041993). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN4. DKFZP434P0111 (Accession XM\_041116) is another VGAM488 host target gene. DKFZP434P0111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:33458, to the nucleotide sequence of

VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22283] Another function of VGAM488 is therefore inhibition of DKFZP434P0111 (Accession XM\_041116). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. EFA6R (Accession NM\_015310) is another VGAM488 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17625, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22284] Another function of VGAM488 is therefore inhibition of EFA6R (Accession NM\_015310). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. HEMK (Accession NM\_016173) is another VGAM488 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18273, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22285] Another function of VGAM488 is therefore inhibition of HEMK (Accession NM\_016173). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. KIAA1615 (Accession XM\_044021) is another VGAM488 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34085, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22286] Another function of VGAM488 is therefore inhibition of KIAA1615 (Accession XM\_044021). Accordingly, utilities

of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. UQCR (Accession NM\_006830) is another VGAM488 host target gene. UQCR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UQCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UQCR BINDING SITE, designated SEQ ID:13711, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22287] Another function of VGAM488 is therefore inhibition of UQCR (Accession NM\_006830). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UQCR. ZF5128 (Accession NM\_014347) is another VGAM488 host target gene. ZF5128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZF5128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF5128 BINDING SITE, designated

SEQ ID:15670, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22288] Another function of VGAM488 is therefore inhibition of ZF5128 (Accession NM\_014347). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF5128. LOC152273 (Accession XM\_087429) is another VGAM488 host target gene. LOC152273 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152273 BINDING SITE, designated SEQ ID:39247, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22289] Another function of VGAM488 is therefore inhibition of LOC152273 (Accession XM\_087429). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152273. LOC157381 (Accession XM\_098754) is another VGAM488 host target gene. LOC157381 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157381 BINDING SITE, designated SEQ ID:41790, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22290] Another function of VGAM488 is therefore inhibition of LOC157381 (Accession XM\_098754). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157381. LOC157753 (Accession XM\_088381) is another VGAM488 host target gene. LOC157753 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157753 BINDING SITE, designated SEQ ID:39661, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22291] Another function of VGAM488 is therefore inhibition of

LOC157753 (Accession XM\_088381). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157753. LOC221250 (Accession XM\_166301) is another VGAM488 host target gene. LOC221250 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221250 BINDING SITE, designated SEQ ID:44121, to the nucleotide sequence of VGAM488 RNA, herein designated VGAM RNA, also designated SEQ ID:3199.

[22292] Another function of VGAM488 is therefore inhibition of LOC221250 (Accession XM\_166301). Accordingly, utilities of VGAM488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221250. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 489 (VGAM489) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[22293] VGAM489 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM489 was detected is described hereinabove with reference to Figs. 1–8.

[22294] VGAM489 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM489 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22295] VGAM489 gene encodes a VGAM489 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM489 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM489 precursor RNA is designated SEQ ID:475, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:475 is located at position 8122 relative to the genome of Hepatitis G Virus.

[22296] VGAM489 precursor RNA folds onto itself, forming VGAM489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[22297] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM489 folded precursor RNA into VGAM489 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 45%) nucleotide se-  
quence of VGAM489 RNA is designated SEQ ID:3200, and  
is provided hereinbelow with reference to the sequence  
listing part.

[22298] VGAM489 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM489 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM489 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[22299] VGAM489 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM489 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM489 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[22300] The complementary binding of VGAM489 RNA, herein designated VGAM RNA, to host target binding sites on VGAM489 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM489 host target RNA into VGAM489 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22301] It is appreciated that VGAM489 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM489 host target genes. The mRNA of each one of this plurality of VGAM489 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM489 RNA, herein designated VGAM RNA, and which when bound by VGAM489 RNA causes inhibition of translation of respective one or more VGAM489 host target proteins.

[22302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM489 gene, herein designated VGAM GENE, on one or

more VGAM489 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22303] It is yet further appreciated that a function of VGAM489 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM489 correlate with, and may be deduced from, the identity of the host target genes which VGAM489 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22304] Nucleotide sequences of the VGAM489 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM489 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM489 are further described hereinbelow with reference to Table 1.

[22305] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM489 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM489 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22306] As mentioned hereinabove with reference to Fig. 1, a function of VGAM489 gene, herein designated VGAM is inhibition of expression of VGAM489 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM489 correlate with, and may be deduced from, the identity of the target genes which VGAM489 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22307] Active BCR-related Gene (ABR, Accession NM\_001092) is a

VGAM489 host target gene. ABR BINDING SITE1 and ABR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABR BINDING SITE1 and ABR BINDING SITE2, designated SEQ ID:6747 and SEQ ID:22492 respectively, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22308] A function of VGAM489 is therefore inhibition of Active BCR-related Gene (ABR, Accession NM\_001092), a gene which gtpase-activating protein for rac and cdc42. Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABR. The function of ABR has been established by previous studies. Heisterkamp et al. (1989) described an active BCR-related gene (ABR) that they identified based on its homology with the BCR gene (OMIM Ref. No. 151410) located on chromosome 22. BCR is involved in reciprocal translocations with the ABL oncogene (OMIM Ref. No. 189980) on chromosome 9 in Philadelphia chromosome-positive chronic myelogenous leukemia. Heis-

terkamp et al. (1993) mapped the ABR gene to 17p13.3 by in situ hybridization techniques. McDonald et al. (1994) found that the ABR locus was deleted in 7 of 8 informative cases of medulloblastoma. Using pulsed field gel electrophoresis, they localized a polymorphic marker of the ABR gene to within 220 kb of D17S34. A cosmid contig constructed in this region was used to demonstrate by fluorescence in situ hybridization that the 5-prime to 3-prime transcriptional orientation of the ABR gene is toward the telomere.

[22309] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22310] Heisterkamp, N.; Kaartinen, V.; van Soest, S.; Bokoch, G. M.; Groffen, J. : Human ABR encodes a protein with GAP-rac activity and homology to the DBL nucleotide exchange factor domain. J. Biol. Chem. 268: 16903–16906, 1993. ; and

[22311] McDonald, J. D.; Daneshvar, L.; Willert, J. R.; Matsumura, K.; Waldman, F.; Cogen, P. H. : Physical mapping of chromosome 17p13.3 in the region of a putative tumor suppressor gene import.

[22312] Further studies establishing the function and utilities of

ABR are found in John Hopkins OMIM database record ID 600365, and in cited publications numbered 7740–7742 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM\_000141) is another VGAM489 host target gene. FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6, designated SEQ ID:5637, SEQ ID:23233, SEQ ID:23240, SEQ ID:23287, SEQ ID:23293 and SEQ ID:23299 respectively, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22313] Another function of VGAM489 is therefore inhibition of Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial

dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM\_000141). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR2. HTRA3 (Accession XM\_114416) is another VGAM489 host target gene. HTRA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:42937, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22314] Another function of VGAM489 is therefore inhibition of HTRA3 (Accession XM\_114416). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3. Apolipoprotein L, 2 (APOL2, Accession NM\_030882) is another VGAM489 host target gene. APOL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL2 BINDING SITE, designated SEQ ID:25158, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22315] Another function of VGAM489 is therefore inhibition of Apolipoprotein L, 2 (APOL2, Accession NM\_030882). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL2. FLJ10900 (Accession XM\_037744) is another VGAM489 host target gene. FLJ10900 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10900 BINDING SITE, designated SEQ ID:32668, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22316] Another function of VGAM489 is therefore inhibition of FLJ10900 (Accession XM\_037744). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10900.

FLJ12154 (Accession NM\_021944) is another VGAM489 host target gene. FLJ12154 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12154 BINDING SITE, designated SEQ ID:22465, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22317] Another function of VGAM489 is therefore inhibition of FLJ12154 (Accession NM\_021944). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12154. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_057169) is another VGAM489 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ

ID:27682, SEQ ID:27695 and SEQ ID:16600 respectively, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22318] Another function of VGAM489 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_057169). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. KIAA0157 (Accession NM\_032182) is another VGAM489 host target gene. KIAA0157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0157 BINDING SITE, designated SEQ ID:25898, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22319] Another function of VGAM489 is therefore inhibition of KIAA0157 (Accession NM\_032182). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0157. KIAA0258 (Accession NM\_014785) is another

VGAM489 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16640, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22320] Another function of VGAM489 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. SSB-3 (Accession NM\_080861) is another VGAM489 host target gene. SSB-3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSB-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-3 BINDING SITE, designated SEQ ID:28103, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22321] Another function of VGAM489 is therefore inhibition of SSB-3 (Accession NM\_080861). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-3. LOC143173 (Accession XM\_016685) is another VGAM489 host target gene. LOC143173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143173 BINDING SITE, designated SEQ ID:30270, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22322] Another function of VGAM489 is therefore inhibition of LOC143173 (Accession XM\_016685). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143173. LOC144266 (Accession XM\_084795) is another VGAM489 host target gene. LOC144266 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144266, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144266 BINDING SITE, designated SEQ ID:37710, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22323] Another function of VGAM489 is therefore inhibition of LOC144266 (Accession XM\_084795). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144266. LOC145188 (Accession XM\_085049) is another VGAM489 host target gene. LOC145188 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145188 BINDING SITE, designated SEQ ID:37809, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22324] Another function of VGAM489 is therefore inhibition of LOC145188 (Accession XM\_085049). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145188. LOC151701 (Accession XM\_098109) is another VGAM489 host target gene. LOC151701 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151701 BINDING SITE, designated SEQ ID:41386, to the nucleotide sequence of VGAM489 RNA, herein designated VGAM RNA, also designated SEQ ID:3200.

[22325] Another function of VGAM489 is therefore inhibition of LOC151701 (Accession XM\_098109). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151701. LOC92912 (Accession XM\_047970) is another VGAM489 host target gene. LOC92912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92912 BINDING SITE, designated SEQ ID:35084, to the nucleotide sequence of VGAM489 RNA, herein designated

VGAM RNA, also designated SEQ ID:3200.

[22326] Another function of VGAM489 is therefore inhibition of LOC92912 (Accession XM\_047970). Accordingly, utilities of VGAM489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92912. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 490 (VGAM490) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22327] VGAM490 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM490 was detected is described hereinabove with reference to Figs. 1–8.

[22328] VGAM490 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22329] VGAM490 gene encodes a VGAM490 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM490 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM490 precursor RNA is designated SEQ ID:476, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:476 is located at position 776 relative to the genome of Hepatitis G Virus.

[22330] VGAM490 precursor RNA folds onto itself, forming VGAM490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22331] An enzyme complex designated DICER COMPLEX, `dices` the VGAM490 folded precursor RNA into VGAM490 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM490 RNA is designated SEQ ID:3201, and is provided hereinbelow with reference to the sequence listing part.

[22332] VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM490 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[22333] VGAM490 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM490 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM490 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22334] The complementary binding of VGAM490 RNA, herein designated VGAM RNA, to host target binding sites on VGAM490 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM490 host target RNA into VGAM490 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22335] It is appreciated that VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM490 host target genes. The mRNA of

each one of this plurality of VGAM490 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM490 RNA, herein designated VGAM RNA, and which when bound by VGAM490 RNA causes inhibition of translation of respective one or more VGAM490 host target proteins.

[22336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM490 gene, herein designated VGAM GENE, on one or more VGAM490 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[22337] It is yet further appreciated that a function of VGAM490 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM490 correlate with, and may be deduced from, the identity of the host target genes which VGAM490 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[22338] Nucleotide sequences of the VGAM490 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM490 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM490 are further described hereinbelow with reference to Table 1.

[22339] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM490 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM490 RNA, herein desig–

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[22340] As mentioned hereinabove with reference to Fig. 1, a function of VGAM490 gene, herein designated VGAM is inhibition of expression of VGAM490 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM490 correlate with, and may be deduced from, the identity of the target genes which VGAM490 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22341] Adenylate Cyclase 2 (brain) (ADCY2, Accession XM\_036383) is a VGAM490 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:32432, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22342] A function of VGAM490 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM\_036383), a gene which Adenylate cyclase (type 2), an ATP-

pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Myosin IIIA (MYO3A, Accession XM\_011851) is another VGAM490 host target gene. MYO3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYO3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO3A BINDING SITE, designated SEQ ID:30196, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22343] Another function of VGAM490 is therefore inhibition of Myosin IIIA (MYO3A, Accession XM\_011851), a gene which may have a role in photoreceptor function and/or maintenance. Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO3A. The function of MYO3A

has been established by previous studies. Actin-dependent motor proteins are members of the large myosin superfamily and are categorized into conventional myosins (class II) and unconventional myosins (classes I and III through XV) based on their variable C-terminal cargo-binding domains. Class III myosins, such as MYO3A, have a kinase domain N-terminal to the conserved N-terminal motor domains and are expressed in photoreceptors. Walsh et al. (2002) showed that normal hearing in humans requires myosin IIIA, which is the human homolog of NINAC, a class III myosin that is required for normal vision in *Drosophila*. In an extended Israeli family, they showed that nonsyndromic progressive hearing loss is caused by 3 different recessive, loss of function mutations in myosin IIIA. Of 18 affected relatives in this family, 7 were homozygous and 11 were compound heterozygous for pairs of mutant alleles. Expression of mammalian myosin IIIA is highly restricted, with the strongest expression in retina and cochlea. The involvement of homologous class III myosins in both *Drosophila* vision and human hearing is an evolutionary link between these sensory systems.

[22344] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[22345] Dose, A. C.; Burnside, B. : Cloning and chromosomal localization of a human class III myosin. Genomics 67: 333–342, 2000. ; and

[22346] Walsh, T.; Walsh, V.; Vreugde, S.; Hertzano, R.; Shahin, H.; Haika, S.; Lee, M. K.; Kanaan, M.; King, M.–C.; Avraham, K. B. : From flies' eyes to our ears: mutations in a human class I.

[22347] Further studies establishing the function and utilities of MYO3A are found in John Hopkins OMIM database record ID 606808, and in cited publications numbered 6140–6141 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400) is another VGAM490 host target gene. PLA2G2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE, designated SEQ ID:14766, to the nucleotide sequence of VGAM490 RNA,

herein designated VGAM RNA, also designated SEQ ID:3201.

[22348] Another function of VGAM490 is therefore inhibition of Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400), a gene which is involved in phospholipid digestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes. Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G2D. The function of PLA2G2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.DKFZP564O0423 (Accession XM\_166254) is another VGAM490 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44062, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22349] Another function of VGAM490 is therefore inhibition of DKFZP564O0423 (Accession XM\_166254). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. FLJ14564 (Accession XM\_084459) is another VGAM490 host target gene. FLJ14564 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14564 BINDING SITE, designated SEQ ID:37594, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22350] Another function of VGAM490 is therefore inhibition of FLJ14564 (Accession XM\_084459). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14564. KIAA0514 (Accession NM\_014696) is another VGAM490 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16201, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22351] Another function of VGAM490 is therefore inhibition of KIAA0514 (Accession NM\_014696). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA1522 (Accession XM\_036299) is another VGAM490 host target gene. KIAA1522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:32417, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22352] Another function of VGAM490 is therefore inhibition of KIAA1522 (Accession XM\_036299). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1522. KIAA1535 (Accession XM\_086565) is another VGAM490 host target gene. KIAA1535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1535 BINDING SITE, designated SEQ ID:38766, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22353] Another function of VGAM490 is therefore inhibition of KIAA1535 (Accession XM\_086565). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1535. KIAA1656 (Accession XM\_038022) is another VGAM490 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32725, to the nucleotide sequence of VGAM490 RNA, herein designated

VGAM RNA, also designated SEQ ID:3201.

[22354] Another function of VGAM490 is therefore inhibition of KIAA1656 (Accession XM\_038022). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. MAD4 (Accession NM\_006454) is another VGAM490 host target gene. MAD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD4 BINDING SITE, designated SEQ ID:13169, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22355] Another function of VGAM490 is therefore inhibition of MAD4 (Accession NM\_006454). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD4. NKX2B (Accession NM\_002509) is another VGAM490 host target gene. NKX2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX2B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX2B BINDING SITE, designated SEQ ID:8342, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22356] Another function of VGAM490 is therefore inhibition of NKX2B (Accession NM\_002509). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX2B. Target of Myb1 (chicken) (TOM1, Accession NM\_005488) is another VGAM490 host target gene. TOM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOM1 BINDING SITE, designated SEQ ID:11984, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22357] Another function of VGAM490 is therefore inhibition of Target of Myb1 (chicken) (TOM1, Accession NM\_005488). Accordingly, utilities of VGAM490 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with TOM1. TP53TG3 (Accession NM\_015369) is another VGAM490 host target gene. TP53TG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TP53TG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53TG3 BINDING SITE, designated SEQ ID:17668, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22358] Another function of VGAM490 is therefore inhibition of TP53TG3 (Accession NM\_015369). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53TG3. LOC149267 (Accession NM\_138480) is another VGAM490 host target gene. LOC149267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149267 BINDING SITE, designated SEQ ID:28830, to the nucleotide se-

quence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22359] Another function of VGAM490 is therefore inhibition of LOC149267 (Accession NM\_138480). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149267. LOC150960 (Accession XM\_087059) is another VGAM490 host target gene. LOC150960 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150960 BINDING SITE, designated SEQ ID:39030, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22360] Another function of VGAM490 is therefore inhibition of LOC150960 (Accession XM\_087059). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150960. LOC164714 (Accession XM\_104657) is another VGAM490 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42175, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22361] Another function of VGAM490 is therefore inhibition of LOC164714 (Accession XM\_104657). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC203292 (Accession XM\_117527) is another VGAM490 host target gene. LOC203292 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203292 BINDING SITE, designated SEQ ID:43499, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22362] Another function of VGAM490 is therefore inhibition of LOC203292 (Accession XM\_117527). Accordingly, utilities

of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203292. LOC257364 (Accession XM\_170768) is another VGAM490 host target gene. LOC257364 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257364 BINDING SITE, designated SEQ ID:45524, to the nucleotide sequence of VGAM490 RNA, herein designated VGAM RNA, also designated SEQ ID:3201.

[22363] Another function of VGAM490 is therefore inhibition of LOC257364 (Accession XM\_170768). Accordingly, utilities of VGAM490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257364. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 491 (VGAM491) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22364] VGAM491 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM491 was detected is described hereinabove with reference to Figs. 1–8.

[22365] VGAM491 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM491 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22366] VGAM491 gene encodes a VGAM491 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM491 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM491 precursor RNA is designated SEQ ID:477, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:477 is located at position 1627 relative to the genome of Hepatitis G Virus.

[22367] VGAM491 precursor RNA folds onto itself, forming VGAM491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22368] An enzyme complex designated DICER COMPLEX, `dices` the VGAM491 folded precursor RNA into VGAM491 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM491 RNA is designated SEQ ID:3202, and is provided hereinbelow with reference to the sequence listing part.

[22369] VGAM491 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM491 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[22370] VGAM491 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM491 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM491 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22371] The complementary binding of VGAM491 RNA, herein designated VGAM RNA, to host target binding sites on VGAM491 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM491 host target RNA into VGAM491 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22372] It is appreciated that VGAM491 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM491 host target genes. The mRNA of each one of this plurality of VGAM491 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM491 RNA, herein designated VGAM RNA, and which when bound by VGAM491 RNA causes inhibition of translation of respective one or more VGAM491 host target proteins.

[22373] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM491 gene, herein designated VGAM GENE, on one or more VGAM491 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22374] It is yet further appreciated that a function of VGAM491 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM491 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM491 correlate with, and may be deduced from, the identity of the host target genes which VGAM491 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22375] Nucleotide sequences of the VGAM491 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM491 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM491 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM491 are further  
described hereinbelow with reference to Table 1.

[22376] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM491 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM491 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[22377] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM491 gene, herein designated VGAM is  
inhibition of expression of VGAM491 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM491 correlate with, and may be deduced  
from, the identity of the target genes which VGAM491  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[22378] Casein Kinase 1, Gamma 2 (CSNK1G2, Accession  
NM\_001319) is a VGAM491 host target gene. CSNK1G2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSNK1G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1G2 BINDING SITE, designated SEQ ID:7007, to the nucleotide sequence of VGAM491 RNA, herein designated VGAM RNA, also designated SEQ ID:3202.

[22379] A function of VGAM491 is therefore inhibition of Casein Kinase 1, Gamma 2 (CSNK1G2, Accession NM\_001319). Accordingly, utilities of VGAM491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G2. KIAA0669 (Accession NM\_014779) is another VGAM491 host target gene. KIAA0669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0669 BINDING SITE, designated SEQ ID:16624, to the nucleotide sequence of VGAM491 RNA, herein designated VGAM RNA, also designated SEQ

ID:3202.

[22380] Another function of VGAM491 is therefore inhibition of KIAA0669 (Accession NM\_014779). Accordingly, utilities of VGAM491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0669. Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM\_006887) is another VGAM491 host target gene. ZFP36L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZFP36L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L2 BINDING SITE, designated SEQ ID:13751, to the nucleotide sequence of VGAM491 RNA, herein designated VGAM RNA, also designated SEQ ID:3202.

[22381] Another function of VGAM491 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM\_006887). Accordingly, utilities of VGAM491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L2. LOC147929 (Accession XM\_085961) is another VGAM491 host target gene. LOC147929 BINDING SITE is HOST TARGET binding

site found in the 5' untranslated region of mRNA encoded by LOC147929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147929 BINDING SITE, designated SEQ ID:38421, to the nucleotide sequence of VGAM491 RNA, herein designated VGAM RNA, also designated SEQ ID:3202.

[22382] Another function of VGAM491 is therefore inhibition of LOC147929 (Accession XM\_085961). Accordingly, utilities of VGAM491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147929. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 492 (VGAM492) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22383] VGAM492 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM492 was detected is described hereinabove with reference to Figs. 1-8.

[22384] VGAM492 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus.

VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22385] VGAM492 gene encodes a VGAM492 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM492 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM492 precursor RNA is designated SEQ ID:478, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:478 is located at position 4128 relative to the genome of Hepatitis G Virus.

[22386] VGAM492 precursor RNA folds onto itself, forming VGAM492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[22387] An enzyme complex designated DICER COMPLEX, `dices` the VGAM492 folded precursor RNA into VGAM492 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM492 RNA is designated SEQ ID:3203, and is provided hereinbelow with reference to the sequence listing part.

[22388] VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM492 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22389] VGAM492 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM492 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM492 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM492 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22390] The complementary binding of VGAM492 RNA, herein designated VGAM RNA, to host target binding sites on VGAM492 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM492 host target RNA into VGAM492 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22391] It is appreciated that VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM492 host target genes. The mRNA of each one of this plurality of VGAM492 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM492 RNA, herein designated VGAM RNA, and which when bound by VGAM492 RNA causes inhibition of translation of respective one or more VGAM492 host target proteins.

[22392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM492 gene, herein designated VGAM GENE, on one or more VGAM492 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22393] It is yet further appreciated that a function of VGAM492 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM492 correlate with, and may be deduced from, the identity of the host target genes which VGAM492 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22394] Nucleotide sequences of the VGAM492 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM492 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM492 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM492 are further described hereinbelow with reference to Table 1.

[22395] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM492 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM492 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22396] As mentioned hereinabove with reference to Fig. 1, a function of VGAM492 gene, herein designated VGAM is inhibition of expression of VGAM492 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM492 correlate with, and may be deduced from, the identity of the target genes which VGAM492 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22397] APG5 Autophagy 5-like (*S. cerevisiae*) (APG5L, Accession NM\_004849) is a VGAM492 host target gene. APG5L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by APG5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of APG5L BINDING SITE, designated SEQ ID:11264, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22398] A function of VGAM492 is therefore inhibition of APG5 Autophagy 5-like (*S. cerevisiae*) (APG5L, Accession NM\_004849), a gene which conjugates to apg12 and associates with isolation membrane to form cup-shaped isolation membrane and autophagosome. Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APG5L. The function of APG5L has been established by previous studies. Apoptosis is an active form of cell death and is of fundamental importance in tissue development and homeostasis. Grand et al. (1995) observed that human and rodent cells undergoing apoptosis expressed high levels of a novel 45-kD protein, which they termed apoptosis-specific protein (ASP). They also found ASP in Burkitt lymphoma (OMIM Ref. No. 113970) cells and in adenovirus-transformed human and rat embryo cells induced into apoptosis by a variety of stimuli. The authors did not detect ASP in viable cells or in cells dying passively by necrosis. Microscopy showed high levels of

ASP in the cytoplasm of cells displaying the chromatin condensation and fragmentation patterns typical of apoptosis. The authors observed retention of ASP even when DNA was no longer detectable. Immunofluorescence staining indicated that ASP primarily colocalizes with, but is clearly distinct from, nonmuscle actin (e.g., 102560). Grand et al. (1995) concluded that ASP forms part of, or at least strongly associates with, a modified cytoskeleton unique to cells undergoing apoptosis. Hammond et al. (1998) found that ASP mRNA is present at similar levels in viable and apoptotic cells, whereas ASP protein levels are dramatically higher in apoptotic cells. They concluded that this increase in protein expression is due to increased translation of preexisting ASP mRNA. ASP protein expression is a relatively late event in the apoptotic process, occurring downstream of caspase activity.

[22399] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22400] Grand, R. J. A.; Milner, A. E.; Mustoe, T.; Johnson, G. D.; Owen, D.; Grant, M. L.; Gregory, C. D. : A novel protein expressed in mammalian cells undergoing apoptosis. *Exp. Cell Res.* 218: 439–451, 1995. ; and

[22401] Hammond, E. M.; Brunet, C. L.; Johnson, G. D.; Parkhill, J.; Milner, A. E.; Brady, G.; Gregory, C. D.; Grand, R. J. A. : Homology between a human apoptosis specific protein and the prod.

[22402] Further studies establishing the function and utilities of APG5L are found in John Hopkins OMIM database record ID 604261, and in cited publications numbered 742 and 7435–7436 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM\_006092) is another VGAM492 host target gene. CARD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD4 BINDING SITE, designated SEQ ID:12740, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22403] Another function of VGAM492 is therefore inhibition of Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM\_006092), a gene which Activates CASP9 to

induce apoptosis, regulates activation of NF- $\kappa$ B. Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD4. The function of CARD4 has been established by previous studies. By searching a proprietary EST database for sequences encoding CARD motifs, followed by screening an endothelial cell cDNA library, Bertin et al. (1999) obtained a cDNA encoding CARD4. The deduced 953-amino acid CARD4 protein contains an N-terminal CARD motif, an NBD, and unlike APAF1, 10 tandem leucine-rich repeats in its C terminus. Northern blot analysis revealed abundant expression of a 4.5-kb transcript in adult heart, spleen, and lung, as well as in numerous cancer cell lines and fetal tissues. Yeast 2-hybrid analysis using the CARD domain of CARD4 as bait to screen breast, prostate, and brain cDNA libraries, as well as coimmunoprecipitation analysis, indicated preferential interaction with the CARD of RICK (RIPK2; 603455). Luciferase reporter analysis showed that the CARD domain of CARD4, but not that of APAF1, potently induces activation of nuclear factor  $\kappa$ -B (see OMIM Ref. No. 164011), but not of JUN N-terminal kinase (see OMIM Ref. No. 601158), in a concentration-dependent manner. Us-

ing similar methods, Inohara et al. (1999) cloned and characterized CARD4, which they called NOD1. Northern blot analysis detected wide expression of NOD1. In situ hybridization analysis showed relatively restricted expression of Nod1 in day-15.5 mouse embryos. Confocal microscopy demonstrated that NOD1 is a cytosolic protein. Coimmunoprecipitation analysis revealed that NOD1 preferentially interacts with procaspases containing CARDs or death effector domains (DEDs), as well as with itself, RICK, and CLARP (CFLAR; 603599), but not with RAIDD (CRADD; 603454), APAF1, NIK (OMIM Ref. No. 604655), or other CARD- or DED-containing proteins. Functional analysis indicated that the CARD and NBD of NOD1, but not the LRR, enhance apoptosis induced by CASP9, but not by other caspases or CLARP. The CARD was found to be essential for NOD1 to bind and activate CASP9, as well as to promote apoptosis. Inohara et al. (1999) also observed that NOD1 interacts with RICK in NFkB activation.

[22404] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22405] Bertin, J.; Nir, W.-J.; Fischer, C. M.; Tayber, O. V.; Errada, P. R.; Grant, J. R.; Keilty, J. J.; Gosselin, M. L.; Robison, K. E.;

Wong, G. H. W.; Glucksmann, M. A.; DiStefano, P. S. : Human CARD4 protein is a novel CED-4/Apaf-1 cell death family member that activates NF-kappa-B. J. Biol. Chem. 274: 12955-12958, 1999. ; and

[22406] Inohara, N.; Koseki, T.; del Peso, L.; Hu, Y.; Yee, C.; Chen, S.; Carrio, R.; Merino, J.; Liu, D.; Ni, J.; Nunez, G. : Nod1, an Apaf-1-like activator of caspase-9 and nuclear factor-ka.

[22407] Further studies establishing the function and utilities of CARD4 are found in John Hopkins OMIM database record ID 605980, and in cited publications numbered 6825 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytoplasmic Linker 2 (CYLN2, Accession NM\_003388) is another VGAM492 host target gene. CYLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLN2 BINDING SITE, designated SEQ ID:9424, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22408] Another function of VGAM492 is therefore inhibition of Cytoplasmic Linker 2 (CYLN2, Accession NM\_003388), a gene which associates with microtubules and dendritic lamellar bodies. Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLN2. The function of CYLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM94. Deoxyribonuclease I (DNASE1, Accession NM\_005223) is another VGAM492 host target gene. DNASE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1 BINDING SITE, designated SEQ ID:11716, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22409] Another function of VGAM492 is therefore inhibition of Deoxyribonuclease I (DNASE1, Accession NM\_005223), a gene which seems to be involved in cell death. Accord-

ingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1. The function of DNASE1 has been established by previous studies. Systemic lupus erythematosus (SLE; 152700) is a multifactorial autoimmune disease that is said to affect more than 1 million people in the United States. SLE is characterized by the presence of antinuclear antibodies (ANA) directed against naked DNA and entire nucleosomes. It was thought that the resulting immune complexes accumulate in vessel walls, glomeruli, and joints and cause a hypersensitivity reaction type III that manifests as glomerulonephritis, arthritis, and generalized vasculitis. Several studies had suggested that increased liberation or disturbed clearance of nuclear DNA-protein complexes after cell death may initiate and propagate the disease. Consequently, DNASE1, which is a major nuclease present in serum, urine, and secretata, may be responsible for the removal of DNA from nuclear antigens at sites of high cell turnover and thus prevent SLE. To test this hypothesis, Napirei et al. (2000) generated Dnase1-deficient mice by gene targeting. They found that these animals show the classic symptoms of SLE, namely the presence of ANA, the deposition of immune com-

plexes in glomeruli, and full-blown glomerulonephritis in a Dnase1 dose-dependent manner. Moreover, in agreement with earlier reports, they found Dnase1 activities in serum to be lower in SLE patients than in normal subjects. The findings suggested that lack or reduction of Dnase1 is a critical factor in the initiation of human SLE. In 2 females with systemic lupus erythematosus (OMIM Ref. No. 152700), Yasutomo et al. (2001) identified an A-to-G transition in exon 2 at position 172 of the DNASE1 coding sequence, which resulted in a lys-to-ter substitution at codon 5. These female patients, who were 13 and 17 years of age, respectively, were diagnosed as having SLE based on clinical features, high serum titers of antibodies against double-stranded DNA, and Sjogren syndrome. The 2 patients were unrelated and the family members did not have any signs or symptoms of SLE. The patients had substantially lower levels of DNASE1 activity in the sera than in other SLE patients without a DNASE1 mutation. However, the DNASE1 activity of SLE patients without DNASE1 mutations is lower than that of healthy controls. The patient's B cells had 30 to 50% of the DNASE1 activity of cells from controls, showing that heterozygous mutation of DNASE1 reduces the total activity of this enzyme.

[22410] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22411] Napirei, M.; Karsunky, H.; Zevnik, B.; Stephan, H.; Mannherz, H. G.; Moroy, T. : Features of systemic lupus erythematosus in Dnase1-deficient mice. Nature Genet. 25: 177-181, 2000. ; and

[22412] Yasutomo, K.; Horiuchi, T.; Kagami, S.; Tsukamoto, H.; Hashimura, C.; Urushihara, M.; Kuroda, Y. : Mutation of DNASE1 in people with systemic lupus erythematosus. Nature Genet. 28: 31.

[22413] Further studies establishing the function and utilities of DNASE1 are found in John Hopkins OMIM database record ID 125505, and in cited publications numbered 3737-3743 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM\_002250) is another VGAM492 host target gene. KCNN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KCNN4 BINDING SITE, designated SEQ ID:8039, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22414] Another function of VGAM492 is therefore inhibition of Potassium Intermediate/small Conductance Calcium-activated Channel, Subfamily N, Member 4 (KCNN4, Accession NM\_002250), a gene which forms a voltage-independent potassium channel that is activated by intracellular calcium. Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNN4. The function of KCNN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.ARL8 (Accession XM\_167671) is another VGAM492 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE,

designated SEQ ID:44764, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22415] Another function of VGAM492 is therefore inhibition of ARL8 (Accession XM\_167671). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM\_017575) is another VGAM492 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19007, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22416] Another function of VGAM492 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM\_017575). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. Diacyl-

glycerol Kinase, Delta 130kDa (DGKD, Accession XM\_002384) is another VGAM492 host target gene. DGKD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE, designated SEQ ID:29887, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22417] Another function of VGAM492 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM\_002384). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. KIAA1649 (Accession NM\_032311) is another VGAM492 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:26110, to the nucleotide sequence of VGAM492

RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22418] Another function of VGAM492 is therefore inhibition of KIAA1649 (Accession NM\_032311). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. MBC3205 (Accession NM\_033408) is another VGAM492 host target gene. MBC3205 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MBC3205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBC3205 BINDING SITE, designated SEQ ID:27225, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22419] Another function of VGAM492 is therefore inhibition of MBC3205 (Accession NM\_033408). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBC3205. Transducer of ERBB2, 2 (TOB2, Accession XM\_170995) is another VGAM492 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45769, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22420] Another function of VGAM492 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM\_170995). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. Target of Myb1 (chicken) (TOM1, Accession NM\_005488) is another VGAM492 host target gene. TOM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOM1 BINDING SITE, designated SEQ ID:11987, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22421] Another function of VGAM492 is therefore inhibition of

Target of Myb1 (chicken) (TOM1, Accession NM\_005488). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOM1. LOC144667 (Accession XM\_096648) is another VGAM492 host target gene. LOC144667 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144667 BINDING SITE, designated SEQ ID:40452, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22422] Another function of VGAM492 is therefore inhibition of LOC144667 (Accession XM\_096648). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144667. LOC220370 (Accession XM\_166943) is another VGAM492 host target gene. LOC220370 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220370, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220370 BINDING SITE, designated SEQ ID:44599, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22423] Another function of VGAM492 is therefore inhibition of LOC220370 (Accession XM\_166943). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220370. LOC222255 (Accession XM\_168616) is another VGAM492 host target gene. LOC222255 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222255 BINDING SITE, designated SEQ ID:45272, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22424] Another function of VGAM492 is therefore inhibition of LOC222255 (Accession XM\_168616). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC222255. LOC253070 (Accession XM\_173088) is another VGAM492 host target gene. LOC253070 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253070 BINDING SITE, designated SEQ ID:46354, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22425] Another function of VGAM492 is therefore inhibition of LOC253070 (Accession XM\_173088). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253070. LOC257054 (Accession XM\_171010) is another VGAM492 host target gene. LOC257054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257054 BINDING SITE, designated SEQ ID:45783, to the nucleotide sequence of VGAM492 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3203.

[22426] Another function of VGAM492 is therefore inhibition of LOC257054 (Accession XM\_171010). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257054. LOC93259 (Accession XM\_050105) is another VGAM492 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35558, to the nucleotide sequence of VGAM492 RNA, herein designated VGAM RNA, also designated SEQ ID:3203.

[22427] Another function of VGAM492 is therefore inhibition of LOC93259 (Accession XM\_050105). Accordingly, utilities of VGAM492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 493 (VGAM493) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22428] VGAM493 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM493 was detected is described hereinabove with reference to Figs. 1–8.

[22429] VGAM493 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22430] VGAM493 gene encodes a VGAM493 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM493 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM493 precursor RNA is designated SEQ ID:479, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:479 is located at position 7135 relative to the genome of Hepatitis G Virus.

[22431] VGAM493 precursor RNA folds onto itself, forming

VGAM493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22432] An enzyme complex designated DICER COMPLEX, `dices` the VGAM493 folded precursor RNA into VGAM493 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM493 RNA is designated SEQ ID:3204, and is provided hereinbelow with reference to the sequence listing part.

[22433] VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM493 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[22434] VGAM493 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM493 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM493 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22435] The complementary binding of VGAM493 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM493 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM493 host target RNA into VGAM493 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22436] It is appreciated that VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM493 host target genes. The mRNA of each one of this plurality of VGAM493 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM493 RNA, herein designated VGAM RNA, and which when bound by VGAM493 RNA causes inhibition of translation of respective one or more VGAM493 host target proteins.

[22437] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM493 gene, herein designated VGAM GENE, on one or more VGAM493 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22438] It is yet further appreciated that a function of VGAM493 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM493 correlate with, and may be deduced from, the identity of the host target genes which VGAM493 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22439] Nucleotide sequences of the VGAM493 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM493 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM493 are further described hereinbelow with reference to Table 1.

[22440] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM493 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM493 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22441] As mentioned hereinabove with reference to Fig. 1, a function of VGAM493 gene, herein designated VGAM is inhibition of expression of VGAM493 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM493 correlate with, and may be deduced from, the identity of the target genes which VGAM493 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22442] Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147) is a VGAM493 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42726, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22443] A function of VGAM493 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Fc Fragment of IgG, Low Affinity Ila, Receptor For (CD32) (FCGR2A, Accession XM\_086483) is another VGAM493 host target gene. FCGR2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FCGR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of FCGR2A BINDING SITE, designated SEQ ID:38701, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22444] Another function of VGAM493 is therefore inhibition of Fc Fragment of IgG, Low Affinity Ila, Receptor For (CD32) (FCGR2A, Accession XM\_086483), a gene which binds IgG immune complexes; member of the immunoglobulin superfamily. Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCGR2A. The function of FCGR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444. Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM\_015839) is another VGAM493 host target gene. FCN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCN2 BINDING SITE, designated SEQ ID:17952, to the nucleotide se-

quence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22445] Another function of VGAM493 is therefore inhibition of Ficolin (collagen/fibrinogen domain containing lectin) 2 (hucolin) (FCN2, Accession NM\_015839), a gene which is involved in phagocytosis of pathogens. Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCN2. The function of FCN2 has been established by previous studies. Matsushita et al. (1996) reported the cloning and characterization of P35, a human lectin with collagen and fibrinogen domains. The P35 gene encodes ficolin 2 (FCN2). Endo et al. (1996) isolated genomic clones for P35 and a related gene shown to be identical to ficolin 1 (OMIM Ref. No. 601252). Endo et al. (1996) mapped both genes to 9q34 by fluorescence in situ hybridization.

[22446] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22447] Endo, Y.; Sato, Y.; Matsushita, M.; Fujita, T. : Cloning and characterization of the human lectin P35 gene and its related gene. Genomics 36: 515–521, 1996. ; and

- [22448] Matsushita, M.; Endo, Y.; Taira, S.; Sato, Y.; Fujita, T.; Ichikawa, N.; Nakata, M.; Misuochi, T. : A novel human lectin with collagen- and fibrinogen-like domains which functions as an.
- [22449] Further studies establishing the function and utilities of FCN2 are found in John Hopkins OMIM database record ID 601624, and in cited publications numbered 9383 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphorylase, Glycogen; Brain (PYGB, Accession NM\_002862) is another VGAM493 host target gene. PYGB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGB BINDING SITE, designated SEQ ID:8766, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.
- [22450] Another function of VGAM493 is therefore inhibition of Phosphorylase, Glycogen; Brain (PYGB, Accession NM\_002862). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PYGB. Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM\_003060) is another VGAM493 host target gene. SLC22A5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC22A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A5 BINDING SITE, designated SEQ ID:9025, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22451] Another function of VGAM493 is therefore inhibition of Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM\_003060). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A5. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM\_006359) is another VGAM493 host target gene. SLC9A6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC9A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A6 BINDING SITE, designated SEQ ID:13054, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22452] Another function of VGAM493 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM\_006359), a gene which is involved electroneutral exchange of protons for  $\text{Na}^+$  and  $\text{K}^+$  across the mitochondrial inner membrane. Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A6. The function of SLC9A6 has been established by previous studies. By searching sequence databases for proteins with sequence similarity to the *S. cerevisiae* mitochondrial sodium/hydrogen exchanger Nha2, Numata et al. (1998) identified the deduced protein product of the KIAA0267 cDNA (Nagase et al., 1996), SLC9A6. The KIAA0267-encoded protein shares 30% amino acid sequence identity with *S. cerevisiae* Nha2, and approximately 20 to 24% identity with the mammalian NHE isoforms NHE1 to NHE5 (see OMIM Ref. No. SLC9A5; 600477). Numata et al. (1998), who concluded that the

KIAA0267 cDNA lacks 5-prime coding sequence, isolated a human cDNA containing the complete coding sequence of SLC9A6, which they called NHE6. The deduced 669-amino acid SLC9A6 protein has 12 putative membrane-spanning segments within the N-terminal region, and a hydrophilic C terminus, similar to the topologies predicted for other NHEs. In addition, SLC9A6 has a putative mitochondrial inner membrane targeting signal at its N terminus. Northern blot analysis detected an approximately 5.5-kb SLC9A6 transcript that was ubiquitously expressed, with the most abundant expression in mitochondrion-rich tissues such as brain, skeletal muscle, and heart. Fluorescence microscopy suggested that SLC9A6 localizes to mitochondria. Numata et al. (1998) deleted the *S. cerevisiae* NHA2 gene by homologous disruption and found that benzamil-inhibitable, acid-activated sodium uptake into mitochondria was abolished in the mutant strain. The mutant strain also showed retarded growth on nonfermentable carbon sources and severely reduced survival during the stationary phase of the cell cycle compared with the parental strain, consistent with a defect in aerobic metabolism. The authors suggested that Nha2 and SLC9A6 are homologous sodium/hydrogen ex-

changers that are important for mitochondrial function.

[22453] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22454] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kwarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201–KIAA0280) deduced by analysis of cDNA clones from cell line KG–1 and brain. DNA Res. 3: 321–329, 1996. Note: Supplement: DNA Res. 3: 341–354, 1996. ; and

[22455] Numata, M.; Petrecca, K.; Lake, N.; Orlowski, J. : Identification of a mitochondrial Na<sup>+</sup>/H<sup>+</sup> exchanger. J. Biol. Chem. 273: 6951–6959, 1998.

[22456] Further studies establishing the function and utilities of SLC9A6 are found in John Hopkins OMIM database record ID 300231, and in cited publications numbered 9011–9012 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SRGAP1 (Accession XM\_051143) is another VGAM493 host target gene. SRGAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SRGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRGAP1 BINDING SITE, designated SEQ ID:35756, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22457] Another function of VGAM493 is therefore inhibition of SRGAP1 (Accession XM\_051143). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP1. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621) is another VGAM493 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10981, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22458] Another function of VGAM493 is therefore inhibition of

Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM\_032625) is another VGAM493 host target gene. C7orf13 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C7orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7orf13 BINDING SITE, designated SEQ ID:26344, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22459] Another function of VGAM493 is therefore inhibition of Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM\_032625). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C7orf13. DKFZp547E052 (Accession NM\_032276) is another VGAM493 host target gene. DKFZp547E052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547E052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547E052 BINDING SITE, designated SEQ ID:26032, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22460] Another function of VGAM493 is therefore inhibition of DKFZp547E052 (Accession NM\_032276). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547E052. DKFZP761I2123 (Accession NM\_031449) is another VGAM493 host target gene. DKFZP761I2123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761I2123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761I2123 BINDING SITE,

designated SEQ ID:25464, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22461] Another function of VGAM493 is therefore inhibition of DKFZP761I2123 (Accession NM\_031449). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761I2123. FLJ14082 (Accession NM\_025024) is another VGAM493 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:24608, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22462] Another function of VGAM493 is therefore inhibition of FLJ14082 (Accession NM\_025024). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082. FLJ22169 (Accession NM\_024085) is another VGAM493 host target gene. FLJ22169 BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23524, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22463] Another function of VGAM493 is therefore inhibition of FLJ22169 (Accession NM\_024085). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169. KIAA0133 (Accession NM\_014777) is another VGAM493 host target gene. KIAA0133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0133 BINDING SITE, designated SEQ ID:16609, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22464] Another function of VGAM493 is therefore inhibition of

KIAA0133 (Accession NM\_014777). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0133. KIAA0152 (Accession NM\_014730) is another VGAM493 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16341, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22465] Another function of VGAM493 is therefore inhibition of KIAA0152 (Accession NM\_014730). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA1858 (Accession XM\_040592) is another VGAM493 host target gene. KIAA1858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1858 BINDING SITE, designated SEQ ID:33329, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22466] Another function of VGAM493 is therefore inhibition of KIAA1858 (Accession XM\_040592). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1858. Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM\_018557) is another VGAM493 host target gene. LRP1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1B BINDING SITE, designated SEQ ID:20641, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22467] Another function of VGAM493 is therefore inhibition of Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM\_018557). Accordingly, utilities of VGAM493 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LRP1B. Phosphatidylinositol Glycan, Class Q (PIGQ, Accession NM\_004204) is another VGAM493 host target gene. PIGQ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIGQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGQ BINDING SITE, designated SEQ ID:10399, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22468] Another function of VGAM493 is therefore inhibition of Phosphatidylinositol Glycan, Class Q (PIGQ, Accession NM\_004204). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGQ. Syntaphilin (SNPH, Accession NM\_014723) is another VGAM493 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16302,

to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22469] Another function of VGAM493 is therefore inhibition of Syntaphilin (SNPH, Accession NM\_014723). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. Thioesterase, Adipose Associated (THEA, Accession XM\_038922) is another VGAM493 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32950, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22470] Another function of VGAM493 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM\_038922). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. LOC115110 (Accession XM\_049825) is another VGAM493 host target gene. LOC115110 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35513, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22471] Another function of VGAM493 is therefore inhibition of LOC115110 (Accession XM\_049825). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC147138 (Accession XM\_085717) is another VGAM493 host target gene. LOC147138 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147138 BINDING SITE, designated SEQ ID:38309, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22472] Another function of VGAM493 is therefore inhibition of

LOC147138 (Accession XM\_085717). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147138. LOC151121 (Accession XM\_087102) is another VGAM493 host target gene. LOC151121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151121 BINDING SITE, designated SEQ ID:39053, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22473] Another function of VGAM493 is therefore inhibition of LOC151121 (Accession XM\_087102). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151121. LOC157280 (Accession XM\_058301) is another VGAM493 host target gene. LOC157280 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC157280 BINDING SITE, designated SEQ ID:36592, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22474] Another function of VGAM493 is therefore inhibition of LOC157280 (Accession XM\_058301). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157280. LOC158857 (Accession XM\_098997) is another VGAM493 host target gene. LOC158857 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158857, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158857 BINDING SITE, designated SEQ ID:42032, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22475] Another function of VGAM493 is therefore inhibition of LOC158857 (Accession XM\_098997). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158857. LOC159049 (Accession XM\_099020) is an-

other VGAM493 host target gene. LOC159049 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159049, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159049 BINDING SITE, designated SEQ ID:42058, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22476] Another function of VGAM493 is therefore inhibition of LOC159049 (Accession XM\_099020). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159049. LOC170261 (Accession XM\_093214) is another VGAM493 host target gene. LOC170261 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170261 BINDING SITE, designated SEQ ID:40183, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22477] Another function of VGAM493 is therefore inhibition of LOC170261 (Accession XM\_093214). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170261. LOC205952 (Accession XM\_120685) is another VGAM493 host target gene. LOC205952 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205952 BINDING SITE, designated SEQ ID:43611, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22478] Another function of VGAM493 is therefore inhibition of LOC205952 (Accession XM\_120685). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205952. LOC221756 (Accession XM\_166394) is another VGAM493 host target gene. LOC221756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221756, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221756 BINDING SITE, designated SEQ ID:44242, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22479] Another function of VGAM493 is therefore inhibition of LOC221756 (Accession XM\_166394). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221756. LOC255448 (Accession XM\_170623) is another VGAM493 host target gene. LOC255448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255448 BINDING SITE, designated SEQ ID:45402, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22480] Another function of VGAM493 is therefore inhibition of LOC255448 (Accession XM\_170623). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255448. LOC256586 (Accession XM\_170759) is another VGAM493 host target gene. LOC256586 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256586 BINDING SITE, designated SEQ ID:45513, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22481] Another function of VGAM493 is therefore inhibition of LOC256586 (Accession XM\_170759). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256586. LOC257051 (Accession XM\_172800) is another VGAM493 host target gene. LOC257051 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257051 BINDING SITE, designated SEQ ID:46083, to the nucleotide sequence of VGAM493 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3204.

[22482] Another function of VGAM493 is therefore inhibition of LOC257051 (Accession XM\_172800). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257051. LOC91344 (Accession XM\_037782) is another VGAM493 host target gene. LOC91344 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91344 BINDING SITE, designated SEQ ID:32678, to the nucleotide sequence of VGAM493 RNA, herein designated VGAM RNA, also designated SEQ ID:3204.

[22483] Another function of VGAM493 is therefore inhibition of LOC91344 (Accession XM\_037782). Accordingly, utilities of VGAM493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91344. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 494 (VGAM494) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22484] VGAM494 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM494 was detected is described hereinabove with reference to Figs. 1–8.

[22485] VGAM494 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM494 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22486] VGAM494 gene encodes a VGAM494 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM494 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM494 precursor RNA is designated SEQ ID:480, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:480 is located at position 4566 relative to the genome of Hepatitis G Virus.

[22487] VGAM494 precursor RNA folds onto itself, forming

VGAM494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22488] An enzyme complex designated DICER COMPLEX, `dices` the VGAM494 folded precursor RNA into VGAM494 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM494 RNA is designated SEQ ID:3205, and is provided hereinbelow with reference to the sequence listing part.

[22489] VGAM494 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM494 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22490] VGAM494 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM494 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM494 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22491] The complementary binding of VGAM494 RNA, herein designated VGAM RNA, to host target binding sites on VGAM494 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM494 host target RNA into VGAM494 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22492] It is appreciated that VGAM494 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM494 host target genes. The mRNA of each one of this plurality of VGAM494 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM494 RNA, herein designated VGAM RNA, and which when bound by VGAM494 RNA causes inhibition of translation of respective one or more VGAM494 host target proteins.

[22493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM494 gene, herein designated VGAM GENE, on one or more VGAM494 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22494] It is yet further appreciated that a function of VGAM494 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM494 correlate with, and may be deduced from, the identity of the host target genes which VGAM494 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[22495] Nucleotide sequences of the VGAM494 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM494 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM494 are further described hereinbelow with reference to Table 1.

[22496] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM494 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM494 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22497] As mentioned hereinabove with reference to Fig. 1, a function of VGAM494 gene, herein designated VGAM is inhibition of expression of VGAM494 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM494 correlate with, and may be deduced from, the identity of the target genes which VGAM494 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[22498] ATPase, Class VI, Type 11A (ATP11A, Accession XM\_085028) is a VGAM494 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37801, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22499] A function of VGAM494 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM\_085028). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11A. ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052) is another VGAM494 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ATP7A BINDING SITE, designated SEQ ID:5497, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22500] Another function of VGAM494 is therefore inhibition of ATPase, Cu<sup>++</sup> Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM\_015548) is another VGAM494 host target gene. BPAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BPAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPAG1 BINDING SITE, designated SEQ ID:17809, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22501] Another function of VGAM494 is therefore inhibition of Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM\_015548), a gene which plays a role in cross-linking actin to other cytoskeletal proteins, binds to mi-

crotubules. Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPAG1. The function of BPAG1 has been established by previous studies. Sensory neurodegeneration occurs in mice defective in Bpag1, a gene encoding cytoskeletal linker proteins capable of anchoring neuronal intermediate filaments to actin cytoskeleton. While Bpag1 null mice fail to anchor neurofilaments (NFs), Bpag1/NF null mice still degenerate in the absence of NFs. Yang et al. (1999) reported a novel BPAG1 neural splice form that lacks the actin-binding domain and instead binds and stabilizes microtubules. This interaction is functionally important; in mice and in vitro, neurons lacking BPAG1 displayed short, disorganized, and unstable microtubules defective in axonal transport. BPAG1 neural isoforms represent microtubule-associated proteins that when absent lead to devastating consequences. Moreover, BPAG1 can functionally account for the extraordinary stability of axonal microtubules necessary for transport over long distances. Its isoforms interconnect all 3 cytoskeletal networks, a feature apparently central to neuronal survival. Animal model experiments lend further support to the function of BPAG1. BPAG1 is made by stratified squa-

mous epithelia, where it localizes to the inner surface of specialized integrin-mediated adherens junctions (hemidesmosomes). Guo et al. (1995) explored the function of BPAG1 and its relationship to bullous pemphigoid by targeting the knockout of the Bpag1 gene in mice. Hemidesmosomes were otherwise normal but they lacked the inner plate and had no cytoskeleton attached. Though not affecting cell growth or adhesion to substrate, this change compromised mechanical integrity and influenced migration. Unexpectedly, the mice also developed severe dystonia and sensory nerve degeneration typical of homozygous dystonia musculorum (dt/dt) mice. Guo et al. (1995) showed that the Bpag1 gene is defective in at least 1 strain of mice with spontaneous homozygous dystonia musculorum. As indicated elsewhere, a human homolog of the dystonia musculorum gene (OMIM Ref. No. 600088) has been mapped to 6p12, the same region as the BPAG1 gene. The dt/dt locus is on mouse chromosome 1 in the same region as the Bpag1 locus. Guo et al. (1995) discussed the evidence that they may one and the same. Brown et al. (1995) cloned a candidate dt gene, called dystonin, that is predominantly expressed in the dorsal root ganglia and other sites of neurodegeneration in dt

mice. They showed that the dystonin gene encodes an N-terminal actin-binding domain and a C-terminal portion comprised of the bullous pemphigoid antigen-1 protein; dt and bpag1 are part of the same transcription unit which is partially deleted in a transgenic strain of mice that harbors an insertional mutation at the dt locus and in mice that carry a spontaneous dt mutation. They also demonstrated abnormal dystonin transcripts in a second dt mutant. Thus, they concluded that mutations in the dystonin gene are the primary genetic lesion in dt mice.

[22502] It is appreciated that the abovementioned animal model for BPAG1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[22503] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22504] Yang, Y.; Bauer, C.; Strasser, G.; Wollman, R.; Julien, J.-P.; Fuchs, E. : Integrators of the cytoskeleton that stabilize microtubules. Cell 98: 229-238, 1999. ; and

[22505] Guo, L.; Degenstein, L.; Dowling, J.; Yu, Q.-C.; Wollmann, R.; Perman, B.; Fuchs, E. : Gene targeting of BPAG1: abnormalities in mechanical strength and cell migration in

stratified ep.

[22506] Further studies establishing the function and utilities of BPAG1 are found in John Hopkins OMIM database record ID 113810, and in cited publications numbered 4079–4090 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EphA8 (EPHA8, Accession NM\_020526) is another VGAM494 host target gene. EPHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA8 BINDING SITE, designated SEQ ID:21742, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22507] Another function of VGAM494 is therefore inhibition of EphA8 (EPHA8, Accession NM\_020526), a gene which Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8. The function of EPHA8 has been established by previous studies. See EPH (EPHA1; 179610) for back–

ground on Eph receptors and their ligands, the ephrins. Chan and Watt (1991) identified human and rat DNAs encoding 2 novel members of the EPH subclass of putative receptor protein-tyrosine kinases. Rat cDNA clones encoding EEK (EPH- and ELK-related kinase) were isolated from a brain cDNA library probed with DNA encoding the kinase region of the insulin receptor-related receptor (INSRR; 147671). The EEK protein was predicted to contain all the amino acid residues conserved in the catalytic domains of protein-tyrosine kinases and was most similar to 2 putative receptor protein-tyrosine kinases of the EPH subclass, ELK (EPHB1; 600600) and EPH, showing 69 and 57% identity, respectively. Human genomic DNAs, encoding part of EEK as well as another putative protein tyrosine kinase most similar to ELK (90%) and symbolized ERK (EPHB2; 600997) for ELK-related kinase, were isolated and partially characterized. The novel identity of these 2 EPH-family genes was further supported by Southern blot analysis and localization to human chromosome 1. In Northern blot analysis of rat RNA, DNAs encoding rat EEK and human ERK hybridized to transcripts most abundant in brain and lung, respectively. These 2 new members of the EPH subclass of receptor protein-tyrosine kinases, EEK

and ERK, may therefore have tissue-specific functions distinct from those of the other EPH family members. Animal model experiments lend further support to the function of EPHA8. Park et al. (1997) generated mice homozygous for a mutation that disrupts the gene encoding EPHA8, a member of the Eph family of tyrosine proteinase receptors. EphA8  $-/-$  mice developed to term, were fertile, and did not display obvious anatomical or physiologic defects.

[22508] It is appreciated that the abovementioned animal model for EPHA8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[22509] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22510] Chan, J.; Watt, V. M. : Eek and erk, new members of the eph subclass of receptor protein-tyrosine kinases. *Oncogene* 6: 1057-1061, 1991. ; and

[22511] Park, S.; Frisen, J.; Barbacid, M. : Aberrant axonal projections in mice lacking EphA8 (Eek) tyrosine protein kinase receptors. *EMBO J.* 16: 3106-3114, 1997.

[22512] Further studies establishing the function and utilities of EPHA8 are found in John Hopkins OMIM database record

ID 176945, and in cited publications numbered 12700–12701 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. WD Repeat Domain 1 (WDR1, Accession NM\_017491) is another VGAM494 host target gene. WDR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR1 BINDING SITE, designated SEQ ID:18956, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22513] Another function of VGAM494 is therefore inhibition of WD Repeat Domain 1 (WDR1, Accession NM\_017491). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR1. FLJ10781 (Accession NM\_018215) is another VGAM494 host target gene. FLJ10781 BINDING SITE1 and FLJ10781 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10781, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE1 and FLJ10781 BINDING SITE2, designated SEQ ID:20138 and SEQ ID:20131 respectively, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22514] Another function of VGAM494 is therefore inhibition of FLJ10781 (Accession NM\_018215). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10781. KIAA0450 (Accession NM\_014638) is another VGAM494 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16025, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22515] Another function of VGAM494 is therefore inhibition of KIAA0450 (Accession NM\_014638). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0450. KIAA1492 (Accession XM\_035312) is another VGAM494 host target gene. KIAA1492 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1492 BINDING SITE, designated SEQ ID:32226, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22516] Another function of VGAM494 is therefore inhibition of KIAA1492 (Accession XM\_035312). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1492. Ras and Rab Interactor 3 (RIN3, Accession NM\_024832) is another VGAM494 host target gene. RIN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RIN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:24229, to the nu-

cleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22517] Another function of VGAM494 is therefore inhibition of Ras and Rab Interactor 3 (RIN3, Accession NM\_024832). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3. LOC115110 (Accession XM\_049825) is another VGAM494 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35512, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22518] Another function of VGAM494 is therefore inhibition of LOC115110 (Accession XM\_049825). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC196500 (Accession XM\_113734) is another VGAM494 host target gene. LOC196500 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC196500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196500 BINDING SITE, designated SEQ ID:42384, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22519] Another function of VGAM494 is therefore inhibition of LOC196500 (Accession XM\_113734). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196500. LOC197287 (Accession XM\_027541) is another VGAM494 host target gene. LOC197287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197287 BINDING SITE, designated SEQ ID:30520, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22520] Another function of VGAM494 is therefore inhibition of LOC197287 (Accession XM\_027541). Accordingly, utilities

of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197287. LOC91782 (Accession XM\_040612) is another VGAM494 host target gene. LOC91782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91782 BINDING SITE, designated SEQ ID:33335, to the nucleotide sequence of VGAM494 RNA, herein designated VGAM RNA, also designated SEQ ID:3205.

[22521] Another function of VGAM494 is therefore inhibition of LOC91782 (Accession XM\_040612). Accordingly, utilities of VGAM494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91782. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 495 (VGAM495) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22522] VGAM495 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM495 was detected is described hereinabove with reference to Figs. 1–8.

[22523] VGAM495 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis G Virus. VGAM495 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22524] VGAM495 gene encodes a VGAM495 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM495 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM495 precursor RNA is designated SEQ ID:481, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:481 is located at position 3092 relative to the genome of Hepatitis G Virus.

[22525] VGAM495 precursor RNA folds onto itself, forming VGAM495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22526] An enzyme complex designated DICER COMPLEX, `dices` the VGAM495 folded precursor RNA into VGAM495 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM495 RNA is designated SEQ ID:3206, and is provided hereinbelow with reference to the sequence listing part.

[22527] VGAM495 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM495 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[22528] VGAM495 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM495 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM495 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22529] The complementary binding of VGAM495 RNA, herein designated VGAM RNA, to host target binding sites on VGAM495 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM495 host target RNA into VGAM495 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22530] It is appreciated that VGAM495 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM495 host target genes. The mRNA of each one of this plurality of VGAM495 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM495 RNA, herein designated VGAM RNA, and which when bound by VGAM495 RNA causes inhibition of translation of respective one or more VGAM495 host target proteins.

[22531] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM495 gene, herein designated VGAM GENE, on one or more VGAM495 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22532] It is yet further appreciated that a function of VGAM495 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM495 include diagnosis, prevention and treatment of viral infection by Hepatitis G Virus. Specific functions, and accordingly utilities, of VGAM495 correlate with, and may be deduced from, the identity of the host target genes which VGAM495 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22533] Nucleotide sequences of the VGAM495 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM495 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM495 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM495 are further  
described hereinbelow with reference to Table 1.

[22534] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM495 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM495 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[22535] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM495 gene, herein designated VGAM is  
inhibition of expression of VGAM495 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM495 correlate with, and may be deduced  
from, the identity of the target genes which VGAM495  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[22536] FLJ22056 (Accession NM\_022489) is a VGAM495 host tar-  
get gene. FLJ22056 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by FLJ22056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22056 BINDING SITE, designated SEQ ID:22867, to the nucleotide sequence of VGAM495 RNA, herein designated VGAM RNA, also designated SEQ ID:3206.

[22537] A function of VGAM495 is therefore inhibition of FLJ22056 (Accession NM\_022489). Accordingly, utilities of VGAM495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22056. FLJ30567 (Accession NM\_145022) is another VGAM495 host target gene. FLJ30567 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ30567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30567 BINDING SITE, designated SEQ ID:29631, to the nucleotide sequence of VGAM495 RNA, herein designated VGAM RNA, also designated SEQ ID:3206.

[22538] Another function of VGAM495 is therefore inhibition of

FLJ30567 (Accession NM\_145022). Accordingly, utilities of VGAM495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30567. LOC150142 (Accession XM\_086791) is another VGAM495 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38855, to the nucleotide sequence of VGAM495 RNA, herein designated VGAM RNA, also designated SEQ ID:3206.

[22539] Another function of VGAM495 is therefore inhibition of LOC150142 (Accession XM\_086791). Accordingly, utilities of VGAM495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC199858 (Accession XM\_114040) is another VGAM495 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42642, to the nucleotide sequence of VGAM495 RNA, herein designated VGAM RNA, also designated SEQ ID:3206.

[22540] Another function of VGAM495 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 496 (VGAM496) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22541] VGAM496 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM496 was detected is described hereinabove with reference to Figs. 1–8.

[22542] VGAM496 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 7. VGAM496 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[22543] VGAM496 gene encodes a VGAM496 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM496 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM496 precursor RNA is designated SEQ ID:482, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:482 is located at position 58821 relative to the genome of Human Herpesvirus 7.

[22544] VGAM496 precursor RNA folds onto itself, forming VGAM496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22545] An enzyme complex designated DICER COMPLEX, `dices` the VGAM496 folded precursor RNA into VGAM496 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM496 RNA is designated SEQ ID:3207, and is provided hereinbelow with reference to the sequence listing part.

[22546] VGAM496 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM496 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22547] VGAM496 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM496 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM496 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22548] The complementary binding of VGAM496 RNA, herein designated VGAM RNA, to host target binding sites on VGAM496 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM496 host target RNA into VGAM496 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22549] It is appreciated that VGAM496 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM496 host target genes. The mRNA of each one of this plurality of VGAM496 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM496 RNA, herein designated VGAM RNA, and which when bound by VGAM496 RNA causes inhibition of translation of respective one or more VGAM496 host target proteins.

[22550] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM496 gene, herein designated VGAM GENE, on one or more VGAM496 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22551] It is yet further appreciated that a function of VGAM496 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM496 correlate with, and may be deduced from, the identity of the host target genes which VGAM496 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22552] Nucleotide sequences of the VGAM496 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM496 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM496 are further described hereinbelow with reference to Table 1.

[22553] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM496 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM496 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22554] As mentioned hereinabove with reference to Fig. 1, a function of VGAM496 gene, herein designated VGAM is inhibition of expression of VGAM496 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM496 correlate with, and may be deduced from, the identity of the target genes which VGAM496 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22555] Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609) is a VGAM496 host target gene. ACADSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACADSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:7316, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ

ID:3207.

[22556] A function of VGAM496 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB. Collagen-like Tail Subunit (single strand of homotrimer) of Asymmetric Acetylcholinesterase (COLQ, Accession NM\_005677) is another VGAM496 host target gene. COLQ BINDING SITE1 through COLQ BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COLQ, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COLQ BINDING SITE1 through COLQ BINDING SITE6, designated SEQ ID:12233, SEQ ID:27865, SEQ ID:27859, SEQ ID:27853, SEQ ID:27862 and SEQ ID:27856 respectively, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22557] Another function of VGAM496 is therefore inhibition of Collagen-like Tail Subunit (single strand of homotrimer) of Asymmetric Acetylcholinesterase (COLQ, Accession

NM\_005677). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLQ. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM\_020474) is another VGAM496 host target gene. GALNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT1 BINDING SITE, designated SEQ ID:21722, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22558] Another function of VGAM496 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM\_020474), a gene which transfers an N-acetyl galactosamine (GalNAc) to a serine or threonine residue in the first step of O-linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with GALNT1. The function of GALNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.LFG (Accession XM\_084780) is another VGAM496 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37693, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22559] Another function of VGAM496 is therefore inhibition of LFG (Accession XM\_084780). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005) is another VGAM496 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15208, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22560] Another function of VGAM496 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM\_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM\_006915) is another VGAM496 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:13789, to the nucleotide sequence of VGAM496 RNA, herein designated

VGAM RNA, also designated SEQ ID:3207.

[22561] Another function of VGAM496 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM\_006915). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. SRGAP1 (Accession XM\_051143) is another VGAM496 host target gene. SRGAP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SRGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRGAP1 BINDING SITE, designated SEQ ID:35759, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22562] Another function of VGAM496 is therefore inhibition of SRGAP1 (Accession XM\_051143). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP1. Surfeit 4 (SURF4, Accession NM\_033161) is another VGAM496 host target gene. SURF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by SURF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF4 BINDING SITE, designated SEQ ID:27011, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22563] Another function of VGAM496 is therefore inhibition of Surfeit 4 (SURF4, Accession NM\_033161), a gene which is a conserved integral membrane protein containing multiple putative transmembrane regions. Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF4. The function of SURF4 has been established by previous studies. Using PCR with primers based on the sequence of mouse Surf4 to screen a HeLa cell cDNA library, Reeves and Fried (1995) obtained a cDNA encoding human SURF4. The deduced 269-amino acid protein, which is 60% and 99% identical to the worm and mouse proteins, respectively, contains 7 transmembrane segments, a predicted luminal N terminus, multiple phosphorylation sites, and a double-lysine retrieval motif at the C terminus. Immunoblot analysis showed expression of a 30-kD

membrane protein. Immunofluorescence microscopy demonstrated cytoplasmic expression. Belden and Barlowe (2001) showed that Erv29, the yeast homolog of SURF4, is directly required for packaging glycosylated pro- $\alpha$ -factor (Gpaf) into COPII (see OMIM Ref. No. COPA; 601924) vesicles. Subcellular fractionation experiments indicated that Erv29 is equally distributed between endoplasmic reticulum (ER) and Golgi membranes. Increased expression of Erv29 in the ER alleviated the accumulation of Gpaf. Belden and Barlowe (2001) proposed that Erv29 binds to fully folded Gpaf and probably to other soluble secretory cargo in the ER, after which the Erv29-cargo complexes are packaged into COPII vesicles for transport to the Golgi complex. The authors noted that similar mechanisms have been postulated for ERGIC1 (LMAN1; 601567).

[22564] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22565] Belden, W. J.; Barlowe, C. : Role of Erv29p in collecting soluble secretory proteins into ER-derived transport vesicles. *Science* 294: 1528–1531, 2001. ; and

[22566] Reeves, J. E.; Fried, M. : The surf-4 gene encodes a novel

30 kDa integral membrane protein. Molec. Membr. Biol. 12: 201–208, 1995.

[22567] Further studies establishing the function and utilities of SURF4 are found in John Hopkins OMIM database record ID 185660, and in cited publications numbered 10458–10460 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ABLIM (Accession NM\_002313) is another VGAM496 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8111 and SEQ ID:13544 respectively, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22568] Another function of VGAM496 is therefore inhibition of ABLIM (Accession NM\_002313). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. DKFZP761C169 (Accession XM\_042059) is another

VGAM496 host target gene. DKFZP761C169 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761C169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761C169 BINDING SITE, designated SEQ ID:33679, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22569] Another function of VGAM496 is therefore inhibition of DKFZP761C169 (Accession XM\_042059). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761C169. FLJ10737 (Accession NM\_018198) is another VGAM496 host target gene. FLJ10737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10737 BINDING SITE, designated SEQ ID:20064, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22570] Another function of VGAM496 is therefore inhibition of FLJ10737 (Accession NM\_018198). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10737. FLJ11273 (Accession NM\_018374) is another VGAM496 host target gene. FLJ11273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11273 BINDING SITE, designated SEQ ID:20394, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22571] Another function of VGAM496 is therefore inhibition of FLJ11273 (Accession NM\_018374). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11273. FLJ11710 (Accession NM\_024846) is another VGAM496 host target gene. FLJ11710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

**BINDING SITE III.** Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:24278, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22572] Another function of VGAM496 is therefore inhibition of FLJ11710 (Accession NM\_024846). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710. FLJ20189 (Accession NM\_017704) is another VGAM496 host target gene. FLJ20189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20189 BINDING SITE, designated SEQ ID:19280, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22573] Another function of VGAM496 is therefore inhibition of FLJ20189 (Accession NM\_017704). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20189.

FLJ20668 (Accession NM\_017923) is another VGAM496 host target gene. FLJ20668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20668 BINDING SITE, designated SEQ ID:19589, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22574] Another function of VGAM496 is therefore inhibition of FLJ20668 (Accession NM\_017923). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20668. FLJ20694 (Accession NM\_017928) is another VGAM496 host target gene. FLJ20694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20694 BINDING SITE, designated SEQ ID:19606, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3207.

[22575] Another function of VGAM496 is therefore inhibition of FLJ20694 (Accession NM\_017928). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20694. FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM\_005971) is another VGAM496 host target gene. FXYD3 BINDING SITE1 and FXYD3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FXYD3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD3 BINDING SITE1 and FXYD3 BINDING SITE2, designated SEQ ID:12594 and SEQ ID:22437 respectively, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22576] Another function of VGAM496 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM\_005971). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD3. KIAA0237 (Accession NM\_014747) is another VGAM496

host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16456, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22577] Another function of VGAM496 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0435 (Accession NM\_014801) is another VGAM496 host target gene. KIAA0435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0435 BINDING SITE, designated SEQ ID:16723, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22578] Another function of VGAM496 is therefore inhibition of KIAA0435 (Accession NM\_014801). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0435. KIAA1729 (Accession XM\_114418) is another VGAM496 host target gene. KIAA1729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:42948, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22579] Another function of VGAM496 is therefore inhibition of KIAA1729 (Accession XM\_114418). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729. MGC10960 (Accession NM\_032653) is another VGAM496 host target gene. MGC10960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10960, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10960 BINDING SITE, designated SEQ ID:26384, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22580] Another function of VGAM496 is therefore inhibition of MGC10960 (Accession NM\_032653). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10960. MGC2865 (Accession NM\_032375) is another VGAM496 host target gene. MGC2865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2865 BINDING SITE, designated SEQ ID:26166, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22581] Another function of VGAM496 is therefore inhibition of MGC2865 (Accession NM\_032375). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2865. RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662) is another VGAM496 host target gene. RAB39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:37647, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22582] Another function of VGAM496 is therefore inhibition of RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_020552) is another VGAM496 host target gene. TCL6 BINDING SITE1 and TCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:21767 and SEQ ID:21774 respectively, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22583] Another function of VGAM496 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_020552). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC127428 (Accession XM\_059144) is another VGAM496 host target gene. LOC127428 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC127428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127428 BINDING SITE, designated SEQ ID:36897, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22584] Another function of VGAM496 is therefore inhibition of LOC127428 (Accession XM\_059144). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC127428. LOC139331 (Accession XM\_066631) is another VGAM496 host target gene. LOC139331 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139331 BINDING SITE, designated SEQ ID:37341, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22585] Another function of VGAM496 is therefore inhibition of LOC139331 (Accession XM\_066631). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139331. LOC147991 (Accession XM\_085993) is another VGAM496 host target gene. LOC147991 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147991 BINDING SITE, designated SEQ ID:38435, to the nucleotide sequence of VGAM496 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3207.

[22586] Another function of VGAM496 is therefore inhibition of LOC147991 (Accession XM\_085993). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147991. LOC149267 (Accession NM\_138480) is another VGAM496 host target gene. LOC149267 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149267 BINDING SITE, designated SEQ ID:28834, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22587] Another function of VGAM496 is therefore inhibition of LOC149267 (Accession NM\_138480). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149267. LOC162333 (Accession XM\_102591) is another VGAM496 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42141, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22588] Another function of VGAM496 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC219673 (Accession XM\_167567) is another VGAM496 host target gene. LOC219673 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219673 BINDING SITE, designated SEQ ID:44695, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22589] Another function of VGAM496 is therefore inhibition of LOC219673 (Accession XM\_167567). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC219673. LOC221301 (Accession XM\_166308) is another VGAM496 host target gene. LOC221301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221301 BINDING SITE, designated SEQ ID:44129, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22590] Another function of VGAM496 is therefore inhibition of LOC221301 (Accession XM\_166308). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221301. LOC221421 (Accession XM\_166428) is another VGAM496 host target gene. LOC221421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221421 BINDING SITE, designated SEQ ID:44321, to

the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22591] Another function of VGAM496 is therefore inhibition of LOC221421 (Accession XM\_166428). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221421. LOC90321 (Accession XM\_030896) is another VGAM496 host target gene. LOC90321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90321 BINDING SITE, designated SEQ ID:31212, to the nucleotide sequence of VGAM496 RNA, herein designated VGAM RNA, also designated SEQ ID:3207.

[22592] Another function of VGAM496 is therefore inhibition of LOC90321 (Accession XM\_030896). Accordingly, utilities of VGAM496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90321. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 497 (VGAM497) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22593] VGAM497 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM497 was detected is described hereinabove with reference to Figs. 1-8.

[22594] VGAM497 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 7. VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22595] VGAM497 gene encodes a VGAM497 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM497 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM497 precursor RNA is designated SEQ ID:483, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:483 is located at position 58211 relative to the genome of Human Herpesvirus 7.

[22596] VGAM497 precursor RNA folds onto itself, forming VGAM497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22597] An enzyme complex designated DICER COMPLEX, `dices` the VGAM497 folded precursor RNA into VGAM497 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM497 RNA is designated SEQ ID:3208, and is provided hereinbelow with reference to the sequence listing part.

[22598] VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM497 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM497 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22599] VGAM497 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM497 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM497 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22600] The complementary binding of VGAM497 RNA, herein designated VGAM RNA, to host target binding sites on VGAM497 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM497 host target RNA into VGAM497 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22601] It is appreciated that VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM497 host target genes. The mRNA of each one of this plurality of VGAM497 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM497 RNA, herein designated VGAM RNA, and which when bound by VGAM497 RNA causes inhibition of translation of respective one or more VGAM497 host target proteins.

[22602] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM497 gene, herein designated VGAM GENE, on one or more VGAM497 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22603] It is yet further appreciated that a function of VGAM497 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM497 correlate with, and may be deduced from, the identity of the

host target genes which VGAM497 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22604] Nucleotide sequences of the VGAM497 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM497 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM497 are further described hereinbelow with reference to Table 1.

[22605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM497 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM497 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22606] As mentioned hereinabove with reference to Fig. 1, a function of VGAM497 gene, herein designated VGAM is inhibition of expression of VGAM497 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM497 correlate with, and may be deduced from, the identity of the target genes which VGAM497

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22607] Amyloid Beta (A4) Precursor Protein (protease nexin-II, Alzheimer disease) (APP, Accession NM\_000484) is a VGAM497 host target gene. APP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APP BINDING SITE, designated SEQ ID:6092, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22608] A function of VGAM497 is therefore inhibition of Amyloid Beta (A4) Precursor Protein (protease nexin-II, Alzheimer disease) (APP, Accession NM\_000484). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APP. Bromodomain and PHD Finger Containing, 1 (BRPF1, Accession XM\_054520) is another VGAM497 host target gene. BRPF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRPF1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRPF1 BINDING SITE, designated SEQ ID:36175, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22609] Another function of VGAM497 is therefore inhibition of Bromodomain and PHD Finger Containing, 1 (BRPF1, Accession XM\_054520), a gene which has 6 zinc finger motifs and a bromodomain. Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRPF1. The function of BRPF1 has been established by previous studies. Thompson et al. (1994) cloned a cDNA encoding a predicted 1,214-amino acid protein that they designated BR140. The BR140 protein, known also as peregrin, has 6 zinc finger motifs and a bromodomain. Thompson et al. (1994) found that BR140 migrates as a 150-kD protein on SDS-PAGE. Northern blots showed that BR140 is expressed ubiquitously. Western blots and immunohistochemistry revealed that BR140 is expressed at the highest level in testes and spermatogonia, and is localized within nuclei. Gregorini et al. (1996) noted that BR140 is very

similar in structure to 2 other zinc finger genes, AF10 (OMIM Ref. No. 602409) and AF17 (MLLT6; 600328) and suggested that they form a family of regulatory proteins. Gregorini et al. (1996) mapped the BR140 gene to 3p25–p26 by fluorescence in situ hybridization.

[22610] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22611] Gregorini, A.; Sahin, F. I.; Lillington, D. M.; Meerabux, J.; Saha, V.; McCullagh, P.; Bocci, M.; Menevse, S.; Papa, S.; Young, B. D. : Gene BR140, which is related to AF10 and AF17, maps to chromosome band 3p25. *Genes Chromosomes Cancer* 17: 269–272, 1996. ; and

[22612] Thompson, K. A.; Wang, B.; Argraves, W. S.; Giancotti, F. G.; Schranck, D. P.; Ruoslahti, E. : BR140, a novel zinc-finger protein with homology to the TAF250 subunit of TFIID. *Biochem.*

[22613] Further studies establishing the function and utilities of BRPF1 are found in John Hopkins OMIM database record ID 602410, and in cited publications numbered 6014–6015 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CAMP Responsive Element Binding Protein 1 (CREB1, Accession NM\_004379)

is another VGAM497 host target gene. CREB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREB1 BINDING SITE, designated SEQ ID:10602, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22614] Another function of VGAM497 is therefore inhibition of CAMP Responsive Element Binding Protein 1 (CREB1, Accession NM\_004379), a gene which regulates expression of cAMP-inducible genes. Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREB1. The function of CREB1 has been established by previous studies. Cyclic AMP (cAMP) second messenger pathways provide a chief means by which cellular growth, differentiation, and function can be influenced by extracellular signals. Following hormonal stimulation of a neuroendocrine cell, for example, increased cAMP levels activate cAMP-dependent protein kinase A, which phosphorylates 1 or more DNA-binding proteins. These in turn stimulate tran-

scription of an array of cAMP-responsive genes such as those for somatostatin (OMIM Ref. No. 182450), alpha-gonadotropin (OMIM Ref. No. 118850), proenkephalin (OMIM Ref. No. 131330) and FOS (OMIM Ref. No. 164810). All cAMP-responsive gene promoters have in common an 8-base enhancer known as the cAMP-response element (CRE) containing a conserved core sequence, 5-prime-TGACG-3-prime, first described in the somatostatin gene by Montminy et al. (1986). Montminy and Bilezikjian (1987) purified a 43-kD nuclear phosphoprotein, which binds to CRE with high affinity. Hoeffler et al. (1988) isolated cDNA clones for human CREB. CREB1 may be identical to activating transcription factor (ATF). By use of a cDNA probe for Southern blot analysis of genomic DNA from a panel of mouse/human somatic cell hybrids and for in situ hybridization, Taylor et al. (1990) mapped CREB1 to 2q32.3-q34. Taylor et al. (1990) speculated about the possible involvement of CREB1 in genetic disorders or cancer and pointed to the fact that TCL4 (OMIM Ref. No. 186860), a locus implicated in T-cell leukemia/lymphoma, is located at 2q34. Cole et al. (1992) demonstrated that the Creb-1 locus maps to the proximal region of mouse chromosome 1. The CREB gene was found to be

single copy in the mouse and well conserved through evolution. Barton et al. (1992) mapped the Creb-1 gene to mouse chromosome 1 by linkage studies. It was found to be approximately 1 cM distal to Cryg and 7 cM proximal to Vil. cAMP mediates the effects of TSH (OMIM Ref. No. 118850) by regulating thyroid follicular cell proliferation, differentiation, and function. To assess the functional importance of the cAMP response element-binding protein (CREB) in thyroid follicular cell regulation in vivo, Nguyen et al. (2000) targeted the expression of a dominant-negative CREB isoform to the thyroid glands of transgenic mice using a tissue-specific promoter. Transgenic mice exhibited severe growth retardation and primary hypothyroidism. Serum levels of TSH were elevated 8-fold above normal levels, and T4 and T3 levels were low. Ciliated thyroid epithelial cells were observed in the transgenic thyroid glands, suggesting a failure of follicular cell differentiation. Nguyen et al. (2000) concluded that these results demonstrate a critical role for CREB in thyroid growth, differentiation, and function in vivo. Animal model experiments lend further support to the function of CREB1. Kida et al. (2002) generated transgenic mice with an inducible and reversible CREB repressor by fusing CREB with a

ser133-to-ala mutation to a tamoxifen-dependent mutant of an estrogen receptor ligand-binding domain. They found that CREB is crucial for the consolidation of long-term conditioned fear memories, but not for encoding, storage, or retrieval of these memories. Their studies also showed that CREB is required for the stability of reactivated or retrieved conditioned fear memories. Although the transcriptional processes necessary for the stability of initial and reactivated memories differ, CREB was found to be required for both.

[22615] It is appreciated that the abovementioned animal model for CREB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[22616] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22617] Barton, C. H.; Ajioka, J. W.; Roach, T. I. A.; Blackwell, J. M. : Mapping Creb-1 to chromosome 1 in the mouse. *Genomics* 14: 790-792, 1992. ; and

[22618] Kida, S.; Josselyn, S. A.; Pena de Ortiz, S.; Kogan, J. H.; Chevere, I.; Masushige, S.; Silva, A. J. : CREB required for the stability of new and reactivated fear memories. *Nature*

Neuros.

[22619] Further studies establishing the function and utilities of CREB1 are found in John Hopkins OMIM database record ID 123810, and in cited publications numbered 11851–11857, 1204 and 150–157 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM\_166516) is another VGAM497 host target gene. DGKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKB BINDING SITE, designated SEQ ID:44448, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22620] Another function of VGAM497 is therefore inhibition of Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM\_166516), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with DGKB. The function of DGKB has been established by previous studies. Diacylglycerol kinase (DGK) plays a key role in cellular processes by regulating the intracellular concentration of the second messenger diacylglycerol (DAG). For background information on the DGKs, see DGK-alpha (80-kD DGK; 125855). Goto and Kondo (1993) isolated rat brain cDNAs encoding a novel 90-kD DGK. The predicted 90-kD DGK protein was 58% identical to the rat 80-kD DGK. Both proteins contain EF-hand motifs, cysteine-rich zinc finger-like sequences, and putative ATP-binding sites. When expressed in mammalian cells, the 90-kD protein exhibited DGK activity. Northern blot analysis revealed that the 90-kD DGK was expressed as an approximately 6.2-kb transcript predominantly in brain. In situ hybridization to rat tissues indicated that the 90-kD DGK was expressed intensely in restricted brain regions such as the caudate putamen and olfactory tubercle. The pattern of expression was different from that of the 80-kD DGK, leading the authors to suggest that there are multiple DGK isozymes, each of which has a characteristic regional pattern of expression. By screening human brain cDNAs for those encoding proteins larger than 50 kD, Nagase et al. (1998) identified KIAA0718, a cDNA

encoding a human homolog of rat Dgkb. Using radiation hybrid analysis, they mapped the DGKB gene to chromosome 7.

[22621] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22622] Goto, K.; Kondo, H. : Molecular cloning and expression of a 90-kDa diacylglycerol kinase that predominantly localizes in neurons. Proc. Nat. Acad. Sci. 90: 7598–7602, 1993. ; and

[22623] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XI. The c.

[22624] Further studies establishing the function and utilities of DGKB are found in John Hopkins OMIM database record ID 604070, and in cited publications numbered 63 and 7048 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM\_138565) is another VGAM497 host target gene. EMS1 BINDING SITE1 and EMS1 BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by EMS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMS1 BINDING SITE1 and EMS1 BINDING SITE2, designated SEQ ID:28868 and SEQ ID:11737 respectively, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22625] Another function of VGAM497 is therefore inhibition of Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM\_138565), a gene which may contribute to the organization of cell structure. in transformed cells may contribute to cellular growth regulation and transformation. Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMS1. The function of EMS1 has been established by previous studies. Amplification of the 11q13 region is frequently found in breast cancer and in squamous cell carcinomas of the head and neck. The known oncogenes within the amplified 11q13 region, INT2 (OMIM Ref. No. 164950) and FGF4 (OMIM Ref. No. 164980), are

rarely expressed in these tumors, indicating that another, hitherto unidentified gene or genes are involved in the unfavorable clinical course of disease associated with such amplification. To identify the gene or genes, Schuuring et al. (1992) constructed a cDNA library from a cell line with an 11q13 amplification and performed a differential cDNA cloning using labeled cDNAs from human squamous cell carcinoma cell lines with and without an 11q13 amplification. They isolated 2 cDNA clones, U21B31 and U21C8, which recognized genes amplified and overexpressed in cell lines harboring an 11q13 amplification. Sequence analysis of the U21C8 cDNA clone revealed no homology to known genes; they called this gene EMS1. The U21B31 cDNA clone corresponded to the 3-prime end of the PRAD1 protooncogene (OMIM Ref. No. 168461). Van Damme et al. (1997) stated that EMS1 is the human homolog of cortactin, an actin-binding protein involved in the restructuring of the cortical actin cytoskeleton. Cortactin is a substrate for the pp60v-src tyrosine kinase (see OMIM Ref. No. 190090). Cortactin is overexpressed in carcinoma cells with an amplification of 11q13 and is found in 2 forms, designated p80 and p85. Van Damme et al. (1997) found that in carcinoma cells with the 11q13

amplification, p85 was produced from p80 by posttranslational modification. Also, treatment of these cells with epidermal growth factor (OMIM Ref. No. 131530) or vanadate caused conversion of p80 to p85 and enhanced phosphorylation of the p85 form. Both overexpression and posttranslational modification of cortactin coincided with its redistribution from the cytoplasm to cell-matrix contact sites, implying a role for cortactin in the modulation of cellular adhesive properties.

[22626] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22627] Schuuring, E.; Verhoeven, E.; Mooi, W. J.; Michalides, R. J. A. M. : Identification and cloning of two overexpressed genes, U21B31/PRAD1 and EMS1, within the amplified chromosome 11q13 region in human carcinomas. *Oncogene* 7: 355–361, 1992. ; and

[22628] van Damme, H.; Brok, H.; Schuuring-Scholtes, E.; Schuuring, E. : The redistribution of cortactin into cell-matrix contact sites in human carcinoma cells with 11q13 amplification is asso.

[22629] Further studies establishing the function and utilities of EMS1 are found in John Hopkins OMIM database record ID

164765, and in cited publications numbered 5098–5099 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM\_022003) is another VGAM497 host target gene. FXYD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FXYD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD6 BINDING SITE, designated SEQ ID:22554, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22630] Another function of VGAM497 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM\_022003). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD6. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982) is another VGAM497 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30609, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22631] Another function of VGAM497 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM\_027982). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM\_000944) is another VGAM497 host target gene. PPP3CA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP3CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CA BINDING SITE, designated SEQ ID:6648, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3208.

[22632] Another function of VGAM497 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM\_000944), a gene which is the catalytic subunit of calcium-dependent, calmodulin-stimulated protein phosphatase. Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CA. The function of PPP3CA has been established by previous studies. Semsarian et al. (1999) and Musaro et al. (1999) independently showed that IGF1 (OMIM Ref. No. 147440) stimulates skeletal muscle hypertrophy and a switch to glycolytic metabolism by activating calcineurin A and inducing the nuclear translocation of transcription factor NFATC1 (OMIM Ref. No. 600489). Semsarian et al. (1999) found that hypertrophy was suppressed by the calcineurin inhibitors cyclosporin A or FK506, but not by inhibitors of the MAP kinase or phosphatidylinositol-3-OH kinase pathways. Musaro et al. (1999) showed that expression of a dominant-negative calcineurin mutant also repressed myocyte differentiation and hypertrophy. Musaro et al. (1999) demonstrated that either IGF1 or activated cal-

calcineurin induces expression of transcription factor GATA2 (OMIM Ref. No. 137295), which accumulates in a subset of myocyte nuclei, where it associates with calcineurin and a specific dephosphorylated isoform of NFATC1. Animal model experiments lend further support to the function of PPP3CA. Winder et al. (1998) generated transgenic mice that overexpressed a truncated form of the murine calcineurin A-alpha catalytic subunit under the control of the CaMKII-alpha promoter. Mice expressing this transgene show increased calcium-dependent phosphatase activity in the hippocampus. Physiologic studies and pharmacologic experiments revealed a novel, intermediate phase of long-term potentiation (I-LTP) in the CA1 region of the hippocampus. This I-LTP differs from the E-LTP (early component of LTP) by requiring multiple trains for induction and in being dependent on PKA (cAMP-dependent protein kinase). It also differs from the L-LTP (late component of LTP) in not requiring new protein synthesis. These data suggested to Winder et al. (1998) that calcineurin acts as an inhibitory constraint on I-LTP that is relieved by PKA, and that this inhibitory constraint acts as a gate to regulate the synaptic induction of L-LTP.

[22633] It is appreciated that the abovementioned animal model

for PPP3CA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[22634] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22635] Winder, D. G.; Mansuy, I. M.; Osman, M.; Moallem, T. M.; Kandel, E. R. : Genetic and pharmacological evidence for a novel, intermediate phase of long-term potentiation suppressed by calcineurin. Cell 92: 25–37, 1998. ; and

[22636] Fuentes, J. J.; Genesca, L.; Kingsbury, T. J.; Cunningham, K. W.; Perez-Riba, M.; Estivill, X.; de la Luna, S. : DSCR1, overexpressed in Down syndrome, is an inhibitor of calcineurin-me.

[22637] Further studies establishing the function and utilities of PPP3CA are found in John Hopkins OMIM database record ID 114105, and in cited publications numbered 4679–4685, 11673–468 and 11674–4689 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_002838) is another VGAM497 host target gene. PTPRC BINDING SITE1 and PTPRC BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by PTPRC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRC BINDING SITE1 and PTPRC BINDING SITE2, designated SEQ ID:8720 and SEQ ID:28146 respectively, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22638] Another function of VGAM497 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_002838). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC. Syndecan 2 (heparan sulfate proteoglycan 1, cell surface-associated, fibroglycan) (SDC2, Accession XM\_040582) is another VGAM497 host target gene. SDC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC2 BINDING SITE, designated SEQ ID:33328, to the nucleotide sequence of

VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22639] Another function of VGAM497 is therefore inhibition of Syndecan 2 (heparan sulfate proteoglycan 1, cell surface-associated, fibroglycan) (SDC2, Accession XM\_040582). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC2. Translocase of Inner Mitochondrial Membrane 8 Homolog A (yeast) (TIMM8A, Accession NM\_004085) is another VGAM497 host target gene. TIMM8A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM8A BINDING SITE, designated SEQ ID:10288, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22640] Another function of VGAM497 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 8 Homolog A (yeast) (TIMM8A, Accession NM\_004085). Accordingly, utilities of VGAM497 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with TIMM8A. Ubiquitously Transcribed Tetratricopeptide Repeat Gene, Y Chromosome (UTY, Accession NM\_007125) is another VGAM497 host target gene. UTY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UTY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UTY BINDING SITE, designated SEQ ID:13983, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22641] Another function of VGAM497 is therefore inhibition of Ubiquitously Transcribed Tetratricopeptide Repeat Gene, Y Chromosome (UTY, Accession NM\_007125), a gene which is an ubiquitous tetratricopeptide repeat protein with unknown function. Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UTY. The function of UTY has been established by previous studies. Greenfield et al. (1996) described a mouse Y-linked gene, Uty, which is widely expressed and encodes a tetratricopeptide repeat (TPR) protein. TPR motifs are found in a variety of func-

tionally distinct proteins and are believed to mediate protein–protein interaction. The 5.5–kb Uty transcript encodes a 1,186 amino acid protein with 8 TPR motifs in its N terminus. Greenfield et al. (1998) reported that the human UTY gene maps to band 5C. This band is known to contain one or more genes functioning in spermatogenesis and a Y–specific growth gene. See 300128 for a description of the X–linked homolog of UTY. Foresta et al. (2000) reported a complete sequence map of the AZFa region (see OMIM Ref. No. 415000), the genomic structure of AZFa genes, and their deletion analysis in 173 infertile men with well–defined spermatogenic alterations. Deletions were found in 9 patients: DBY (OMIM Ref. No. 400010) alone was deleted in 6, DFFRY (USP9Y; 400005) only in 1, and 1 each with USP9Y–DBY or DBY–UTY missing. No patients solely lacked UTY. Patients lacking DBY exhibited either Sertoli cell–only syndrome or severe hypospermatogenesis. The authors suggested that DBY and USP9Y play key roles in the spermatogenic process.

[22642] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22643] Greenfield, A.; Scott, D.; Pennisi, D.; Ehrmann, I.; Ellis, P.;

Cooper, L.; Simpson, E.; Koopman, P. : An H-YDb epitope is encoded by a novel mouse Y chromosome gene. *Nature Genet.* 14: 474–478, 1996. ; and

[22644] Foresta, C.; Ferlin, A.; Moro, E. : Deletion and expression analysis of AZFa genes on the human Y chromosome revealed a major role for DBY in male infertility. *Hum. Molec. Genet.* 9: 1161–11.

[22645] Further studies establishing the function and utilities of UTY are found in John Hopkins OMIM database record ID 400009, and in cited publications numbered 882 and 10988 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AOP2 (Accession NM\_004905) is another VGAM497 host target gene. AOP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AOP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AOP2 BINDING SITE, designated SEQ ID:11342, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22646] Another function of VGAM497 is therefore inhibition of AOP2 (Accession NM\_004905). Accordingly, utilities of

VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOP2.

AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM\_032852) is another VGAM497 host target gene. AUTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AUTL1 BINDING SITE, designated SEQ ID:26651, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22647] Another function of VGAM497 is therefore inhibition of AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM\_032852). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL1. FLJ10719 (Accession XM\_031328) is another VGAM497 host target gene. FLJ10719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10719 BINDING SITE, designated SEQ ID:31341, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22648] Another function of VGAM497 is therefore inhibition of FLJ10719 (Accession XM\_031328). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10719. FLJ12586 (Accession NM\_024620) is another VGAM497 host target gene. FLJ12586 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12586 BINDING SITE, designated SEQ ID:23884, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22649] Another function of VGAM497 is therefore inhibition of FLJ12586 (Accession NM\_024620). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12586.

KIAA1309 (Accession NM\_033495) is another VGAM497 host target gene. KIAA1309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1309 BINDING SITE, designated SEQ ID:27265, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22650] Another function of VGAM497 is therefore inhibition of KIAA1309 (Accession NM\_033495). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1309. MDN1, Midasin Homolog (yeast) (MDN1, Accession XM\_031539) is another VGAM497 host target gene. MDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDN1 BINDING SITE, designated SEQ ID:31411, to the nucleotide sequence of VGAM497 RNA,

herein designated VGAM RNA, also designated SEQ ID:3208.

[22651] Another function of VGAM497 is therefore inhibition of MDN1, Midasin Homolog (yeast) (MDN1, Accession XM\_031539). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDN1. MGC16385 (Accession NM\_145039) is another VGAM497 host target gene. MGC16385 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16385, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16385 BINDING SITE, designated SEQ ID:29663, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22652] Another function of VGAM497 is therefore inhibition of MGC16385 (Accession NM\_145039). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16385. NET-6 (Accession NM\_014399) is another VGAM497 host target gene. NET-6 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by NET-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NET-6 BINDING SITE, designated SEQ ID:15741, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22653] Another function of VGAM497 is therefore inhibition of NET-6 (Accession NM\_014399). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET-6. PRO0246 (Accession NM\_014123) is another VGAM497 host target gene. PRO0246 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0246 BINDING SITE, designated SEQ ID:15382, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22654] Another function of VGAM497 is therefore inhibition of

PRO0246 (Accession NM\_014123). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0246. Synaptophysin-like Protein (SYPL, Accession XM\_167511) is another VGAM497 host target gene. SYPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYPL BINDING SITE, designated SEQ ID:44647, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22655] Another function of VGAM497 is therefore inhibition of Synaptophysin-like Protein (SYPL, Accession XM\_167511). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYPL. VEZATIN (Accession NM\_017599) is another VGAM497 host target gene. VEZATIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VEZATIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of VEZATIN BINDING SITE, designated SEQ ID:19072, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22656] Another function of VGAM497 is therefore inhibition of VEZATIN (Accession NM\_017599). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN. LOC122525 (Accession XM\_071793) is another VGAM497 host target gene. LOC122525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122525 BINDING SITE, designated SEQ ID:37421, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22657] Another function of VGAM497 is therefore inhibition of LOC122525 (Accession XM\_071793). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122525. LOC147495 (Accession XM\_097240) is an-

other VGAM497 host target gene. LOC147495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147495 BINDING SITE, designated SEQ ID:40840, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22658] Another function of VGAM497 is therefore inhibition of LOC147495 (Accession XM\_097240). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147495. LOC148254 (Accession XM\_086121) is another VGAM497 host target gene. LOC148254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148254 BINDING SITE, designated SEQ ID:38506, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22659] Another function of VGAM497 is therefore inhibition of LOC148254 (Accession XM\_086121). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148254. LOC196411 (Accession XM\_113714) is another VGAM497 host target gene. LOC196411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196411 BINDING SITE, designated SEQ ID:42367, to the nucleotide sequence of VGAM497 RNA, herein designated VGAM RNA, also designated SEQ ID:3208.

[22660] Another function of VGAM497 is therefore inhibition of LOC196411 (Accession XM\_113714). Accordingly, utilities of VGAM497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196411. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 498 (VGAM498) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[22661] VGAM498 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM498 was detected is described hereinabove with reference to Figs. 1–8.

[22662] VGAM498 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 7. VGAM498 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22663] VGAM498 gene encodes a VGAM498 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM498 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM498 precursor RNA is designated SEQ ID:484, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:484 is located at position 127367 relative to the genome of Human Herpesvirus 7.

[22664] VGAM498 precursor RNA folds onto itself, forming VGAM498 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[22665] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM498 folded precursor RNA into VGAM498 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 77%) nucleotide se-  
quence of VGAM498 RNA is designated SEQ ID:3209, and  
is provided hereinbelow with reference to the sequence  
listing part.

[22666] VGAM498 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM498 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM498 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22667] VGAM498 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM498 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM498 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22668] The complementary binding of VGAM498 RNA, herein designated VGAM RNA, to host target binding sites on VGAM498 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM498 host target RNA into VGAM498 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22669] It is appreciated that VGAM498 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM498 host target genes. The mRNA of each one of this plurality of VGAM498 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM498 RNA, herein designated VGAM RNA, and which when bound by VGAM498 RNA causes inhibition of translation of respective one or more VGAM498 host target proteins.

[22670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM498 gene, herein designated VGAM GENE, on one or more VGAM498 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22671] It is yet further appreciated that a function of VGAM498 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM498 correlate with, and may be deduced from, the identity of the host target genes which VGAM498 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[22672] Nucleotide sequences of the VGAM498 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM498 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM498 are further described hereinbelow with reference to Table 1.

[22673] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM498 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM498 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22674] As mentioned hereinabove with reference to Fig. 1, a function of VGAM498 gene, herein designated VGAM is inhibition of expression of VGAM498 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM498 correlate with, and may be deduced from, the identity of the target genes which VGAM498 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22675] Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774) is a VGAM498 host target gene. ANK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30289, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22676] A function of VGAM498 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM\_016774). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM\_039627) is another VGAM498 host target gene. CNTN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN3 BINDING SITE, designated SEQ ID:33133, to the nucleotide sequence of VGAM498

RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22677] Another function of VGAM498 is therefore inhibition of Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM\_039627), a gene which may play a role in the initial growth and guidance of axons. Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN3. The function of CNTN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM420. Collagen, Type I, Alpha 1 (COL1A1, Accession NM\_000088) is another VGAM498 host target gene. COL1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL1A1 BINDING SITE, designated SEQ ID:5539, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22678] Another function of VGAM498 is therefore inhibition of

Collagen, Type I, Alpha 1 (COL1A1, Accession NM\_000088). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A1. Hyaluronan Synthase 3 (HAS3, Accession NM\_005329) is another VGAM498 host target gene. HAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAS3 BINDING SITE, designated SEQ ID:11803, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22679] Another function of VGAM498 is therefore inhibition of Hyaluronan Synthase 3 (HAS3, Accession NM\_005329), a gene which plays a role in hyaluronan/hyaluronic acid (ha) synthesis. Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAS3. The function of HAS3 has been established by previous studies. Hyaluronan (HA) is an unbranched glycosaminoglycan composed of repeating disaccharide units. It is a major constituent of the ex-

tracellular matrix and has been implicated in development, tumorigenesis, and several diseases. HA is synthesized at the inner face of the plasma membrane and is subsequently extruded to the outside of the cell. By degenerate PCR, Spicer et al. (1997) isolated a genomic fragment of human HA synthase-3 (HAS3) and genomic and cDNA clones of mouse Has3. The amino acid sequences encoded by the partial HAS3 fragment and the corresponding region of Has3 are 99% conserved. The authors noted that the high degree of sequence conservation between specific human and mouse HASs contrasts with the lower level of identity between HASs within a species, suggesting an evolutionary conservation of functionally important residues and differences in the mode of action of the various HASs. The predicted 554-amino acid Has3 has several consensus HA-binding motifs and multiple transmembrane domains, with 2 at the N terminus and a cluster at the C terminus. Expression of Has3 in COS-1 cells led to high levels of HA biosynthesis. Northern blot analysis of the mouse embryo showed that Has3 is predominantly expressed at late gestation as a major, approximately 6.0- to 6.5-kb transcript and a minor, approximately 4.0-kb transcript. By PCR screening somatic

cell hybrid DNAs and a YAC contig, Spicer et al. (1997) localized the human HAS3 gene to 16q22.1. By interspecific backcross analysis, they mapped the mouse Has3 gene to chromosome 8. Since HAS1 (OMIM Ref. No. 601463), HAS2 (OMIM Ref. No. 601636), and HAS3 are located on different autosomes, Spicer et al. (1997) suggested that the HAS gene family arose comparatively early in vertebrate evolution by sequential duplication of an ancestral HAS gene.

[22680] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22681] Spicer, A. P.; Olson, J. S.; McDonald, J. A. : Molecular cloning and characterization of a cDNA encoding the third putative mammalian hyaluronan synthase. J. Biol. Chem. 272: 8957–8961, 1997. ; and

[22682] Spicer, A. P.; Seldin, M. F.; Olsen, A. S.; Brown, N.; Wells, D. E.; Doggett, N. A.; Itano, N.; Kimata, K.; Inazawa, J.; McDonald, J. A. : Chromosomal localization of the human and mous.

[22683] Further studies establishing the function and utilities of HAS3 are found in John Hopkins OMIM database record ID 602428, and in cited publications numbered 8915 listed

in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM\_032104) is another VGAM498 host target gene.

PPP1R12B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12B BINDING SITE, designated SEQ ID:25797, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22684] Another function of VGAM498 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM\_032104). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12B. Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM\_080392) is another VGAM498 host target gene. PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

PTP4A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2, designated SEQ ID:27832 and SEQ ID:9555 respectively, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22685] Another function of VGAM498 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM\_080392), a gene which is a protein tyrosine phosphatase which has a C-terminal prenylation site. Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A2. The function of PTP4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Usher Syndrome 3A (USH3A, Accession NM\_052995) is another VGAM498 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:27565, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22686] Another function of VGAM498 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM\_052995). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. Vitamin D (1,25– dihydroxyvitamin D3) Receptor (VDR, Accession NM\_000376) is another VGAM498 host target gene. VDR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:5944, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22687] Another function of VGAM498 is therefore inhibition of Vitamin D (1,25– dihydroxyvitamin D3) Receptor (VDR,

Accession NM\_000376). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR. 20D7-FC4 (Accession XM\_027578) is another VGAM498 host target gene. 20D7-FC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by 20D7-FC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 20D7-FC4 BINDING SITE, designated SEQ ID:30537, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22688] Another function of VGAM498 is therefore inhibition of 20D7-FC4 (Accession XM\_027578). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 20D7-FC4. Cbp/p300-interacting Transactivator, with Glu/Asp-rich Carboxy-terminal Domain, 2 (CITED2, Accession NM\_006079) is another VGAM498 host target gene. CITED2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CITED2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CITED2 BINDING SITE, designated SEQ ID:12725, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22689] Another function of VGAM498 is therefore inhibition of Cbp/p300–interacting Transactivator, with Glu/Asp–rich Carboxy–terminal Domain, 2 (CITED2, Accession NM\_006079). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CITED2. DKFZP434L187 (Accession XM\_044070) is another VGAM498 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34124, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22690] Another function of VGAM498 is therefore inhibition of

DKFZP434L187 (Accession XM\_044070). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. FLJ13868 (Accession NM\_022744) is another VGAM498 host target gene. FLJ13868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13868 BINDING SITE, designated SEQ ID:22955, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22691] Another function of VGAM498 is therefore inhibition of FLJ13868 (Accession NM\_022744). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13868. FLJ20070 (Accession NM\_017652) is another VGAM498 host target gene. FLJ20070 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20070 BINDING SITE, designated SEQ ID:19161, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22692] Another function of VGAM498 is therefore inhibition of FLJ20070 (Accession NM\_017652). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20070. FLJ20154 (Accession XM\_053688) is another VGAM498 host target gene. FLJ20154 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20154 BINDING SITE, designated SEQ ID:36104, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22693] Another function of VGAM498 is therefore inhibition of FLJ20154 (Accession XM\_053688). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20154. HSNOV1 (Accession NM\_017515) is another VGAM498

host target gene. HSNOV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSNOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSNOV1 BINDING SITE, designated SEQ ID:18967, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22694] Another function of VGAM498 is therefore inhibition of HSNOV1 (Accession NM\_017515). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSNOV1. KIAA0237 (Accession NM\_014747) is another VGAM498 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16440, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22695] Another function of VGAM498 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0286 (Accession XM\_043118) is another VGAM498 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33903, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22696] Another function of VGAM498 is therefore inhibition of KIAA0286 (Accession XM\_043118). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0286. PDZ-GEF1 (Accession NM\_014247) is another VGAM498 host target gene. PDZ-GEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDZ-GEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZ-GEF1 BINDING SITE, designated SEQ ID:15521, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22697] Another function of VGAM498 is therefore inhibition of PDZ-GEF1 (Accession NM\_014247). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZ-GEF1. LOC151610 (Accession XM\_087245) is another VGAM498 host target gene. LOC151610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151610 BINDING SITE, designated SEQ ID:39138, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22698] Another function of VGAM498 is therefore inhibition of LOC151610 (Accession XM\_087245). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC151610. LOC163231 (Accession XM\_092094) is another VGAM498 host target gene. LOC163231 BINDING SITE1 and LOC163231 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC163231, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE1 and LOC163231 BINDING SITE2, designated SEQ ID:40100 and SEQ ID:40101 respectively, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22699] Another function of VGAM498 is therefore inhibition of LOC163231 (Accession XM\_092094). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. LOC254973 (Accession XM\_172751) is another VGAM498 host target gene. LOC254973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254973 BINDING SITE, designated SEQ ID:46077, to the nucleotide sequence of VGAM498 RNA, herein designated VGAM RNA, also designated SEQ ID:3209.

[22700] Another function of VGAM498 is therefore inhibition of LOC254973 (Accession XM\_172751). Accordingly, utilities of VGAM498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 499 (VGAM499) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22701] VGAM499 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM499 was detected is described hereinabove with reference to Figs. 1–8.

[22702] VGAM499 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Vein Banding Virus (SVBV). VGAM499 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22703] VGAM499 gene encodes a VGAM499 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM499 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM499 precursor RNA is designated SEQ ID:485, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:485 is located at position 4662 relative to the genome of Strawberry Vein Banding Virus (SVBV).

[22704] VGAM499 precursor RNA folds onto itself, forming VGAM499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22705] An enzyme complex designated DICER COMPLEX, `dices` the VGAM499 folded precursor RNA into VGAM499 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM499 RNA is designated SEQ ID:3210, and is provided hereinbelow with reference to the sequence listing part.

[22706] VGAM499 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM499 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22707] VGAM499 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM499 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM499 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22708] The complementary binding of VGAM499 RNA, herein designated VGAM RNA, to host target binding sites on VGAM499 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM499 host target RNA into VGAM499 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22709] It is appreciated that VGAM499 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM499 host target genes. The mRNA of each one of this plurality of VGAM499 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM499 RNA, herein designated VGAM RNA, and which when bound by VGAM499 RNA causes inhibition of translation of respective one or more VGAM499 host target proteins.

[22710] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM499 gene, herein designated VGAM GENE, on one or more VGAM499 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[22711] It is yet further appreciated that a function of VGAM499 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of viral infection by Strawberry Vein Banding Virus (SVBV). Specific functions, and accordingly utilities, of VGAM499 correlate with, and may be deduced from, the identity of the host target genes which VGAM499 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22712] Nucleotide sequences of the VGAM499 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM499 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM499 are further described hereinbelow with reference to Table 1.

[22713] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM499 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM499 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22714] As mentioned hereinabove with reference to Fig. 1, a function of VGAM499 gene, herein designated VGAM is inhibition of expression of VGAM499 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM499 correlate with, and may be deduced from, the identity of the target genes which VGAM499 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22715] Pallidin Homolog (mouse) (PLDN, Accession NM\_012388) is a VGAM499 host target gene. PLDN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLDN BINDING SITE, designated SEQ ID:14743, to the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, also designated SEQ ID:3210.

[22716] A function of VGAM499 is therefore inhibition of Pallidin

Homolog (mouse) (PLDN, Accession NM\_012388), a gene which may play a role in intracellular vesicle trafficking. Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLDN. The function of PLDN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM138.DKFZp547A023 (Accession XM\_052065) is another VGAM499 host target gene. DKFZp547A023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547A023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547A023 BINDING SITE, designated SEQ ID:35942, to the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, also designated SEQ ID:3210.

[22717] Another function of VGAM499 is therefore inhibition of DKFZp547A023 (Accession XM\_052065). Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547A023. FLJ13902 (Accession NM\_024653) is

another VGAM499 host target gene. FLJ13902 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13902 BINDING SITE, designated SEQ ID:23950, to the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, also designated SEQ ID:3210.

[22718] Another function of VGAM499 is therefore inhibition of FLJ13902 (Accession NM\_024653). Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13902. KIAA0429 (Accession NM\_014751) is another VGAM499 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16464, to the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, also designated SEQ ID:3210.

[22719] Another function of VGAM499 is therefore inhibition of KIAA0429 (Accession NM\_014751). Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. KIAA0446 (Accession XM\_044155) is another VGAM499 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34151, to the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, also designated SEQ ID:3210.

[22720] Another function of VGAM499 is therefore inhibition of KIAA0446 (Accession XM\_044155). Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. LOC143888 (Accession XM\_084669) is another VGAM499 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37665, to the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, also designated SEQ ID:3210.

[22721] Another function of VGAM499 is therefore inhibition of LOC143888 (Accession XM\_084669). Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC254266 (Accession XM\_173221) is another VGAM499 host target gene. LOC254266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254266 BINDING SITE, designated SEQ ID:46480, to the nucleotide sequence of VGAM499 RNA, herein designated VGAM RNA, also designated SEQ ID:3210.

[22722] Another function of VGAM499 is therefore inhibition of LOC254266 (Accession XM\_173221). Accordingly, utilities of VGAM499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 500 (VGAM500) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22723] VGAM500 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM500 was detected is described hereinabove with reference to Figs. 1–8.

[22724] VGAM500 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Vein Banding Virus (SVBV). VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22725] VGAM500 gene encodes a VGAM500 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM500 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM500 precursor RNA is designated SEQ ID:486, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:486 is located at position 4531 relative to the genome of Strawberry Vein Banding Virus (SVBV).

[22726] VGAM500 precursor RNA folds onto itself, forming VGAM500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22727] An enzyme complex designated DICER COMPLEX, `dices` the VGAM500 folded precursor RNA into VGAM500 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM500 RNA is designated SEQ ID:3211, and is provided hereinbelow with reference to the sequence listing part.

[22728] VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM500 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22729] VGAM500 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM500 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM500 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22730] The complementary binding of VGAM500 RNA, herein designated VGAM RNA, to host target binding sites on VGAM500 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM500 host target RNA into VGAM500 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22731] It is appreciated that VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM500 host target genes. The mRNA of each one of this plurality of VGAM500 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM500 RNA, herein designated VGAM RNA, and which when bound by VGAM500 RNA causes in-

hibition of translation of respective one or more VGAM500 host target proteins.

[22732] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM500 gene, herein designated VGAM GENE, on one or more VGAM500 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22733] It is yet further appreciated that a function of VGAM500 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM500 include diagnosis, prevention and

treatment of viral infection by Strawberry Vein Banding Virus (SVBV). Specific functions, and accordingly utilities, of VGAM500 correlate with, and may be deduced from, the identity of the host target genes which VGAM500 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22734] Nucleotide sequences of the VGAM500 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM500 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM500 are further described hereinbelow with reference to Table 1.

[22735] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM500 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM500 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22736] As mentioned hereinabove with reference to Fig. 1, a function of VGAM500 gene, herein designated VGAM is inhibition of expression of VGAM500 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM500 correlate with, and may be deduced from, the identity of the target genes which VGAM500 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22737] Adaptor-related Protein Complex 1, Mu 1 Subunit (AP1M1, Accession NM\_032493) is a VGAM500 host target gene. AP1M1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1M1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1M1 BINDING SITE, designated SEQ ID:26244, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22738] A function of VGAM500 is therefore inhibition of Adaptor-related Protein Complex 1, Mu 1 Subunit (AP1M1, Accession NM\_032493), a gene which promotes the formation of clathrin-coated pits and vesicles. Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1M1. The function of AP1M1 has been established by previous

studies. Heterotetrameric adaptor complexes promote the formation of clathrin-coated pits and vesicles. The AP-1 adaptor, localized at the trans-Golgi network, is composed of 2 approximately 100-kD subunits, beta-prime adaptin (OMIM Ref. No. 600157) and gamma-adaptin (OMIM Ref. No. 603533); a medium subunit, AP47; and a small subunit, AP19 (OMIM Ref. No. 603531). Nakayama et al. (1991) isolated a mouse brain cDNA encoding AP47.

[22739] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22740] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP-1 in packaging MPRs at the trans-Golgi network. Science 297: 1700-1703, 2002. ; and

[22741] Nakayama, Y.; Goebel, M.; O'Brine Greco, B.; Lemmon, S.; Pingchang Chow, E.; Kirchhausen, T. : The medium chains of the mammalian clathrin-associated proteins have a homolog in yeast. E.

[22742] Further studies establishing the function and utilities of AP1M1 are found in John Hopkins OMIM database record ID 603535, and in cited publications numbered 12596, 422 and 8521 listed in the bibliography section hereinbe-

low, which are also hereby incorporated by reference. ARPP-21 (Accession NM\_016300) is another VGAM500 host target gene. ARPP-21 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARPP-21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-21 BINDING SITE, designated SEQ ID:18420, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22743] Another function of VGAM500 is therefore inhibition of ARPP-21 (Accession NM\_016300). Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-21. JM4 (Accession NM\_007213) is another VGAM500 host target gene. JM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM4 BINDING SITE, designated SEQ ID:14079, to the nucleotide sequence of VGAM500 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3211.

[22744] Another function of VGAM500 is therefore inhibition of JM4 (Accession NM\_007213). Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM4. MGC4309 (Accession NM\_024115) is another VGAM500 host target gene. MGC4309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4309 BINDING SITE, designated SEQ ID:23569, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22745] Another function of VGAM500 is therefore inhibition of MGC4309 (Accession NM\_024115). Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4309. TED (Accession NM\_015686) is another VGAM500 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TED, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17917, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22746] Another function of VGAM500 is therefore inhibition of TED (Accession NM\_015686). Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. Zinc Finger Protein 273 (ZNF273, Accession XM\_088082) is another VGAM500 host target gene. ZNF273 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF273 BINDING SITE, designated SEQ ID:39509, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22747] Another function of VGAM500 is therefore inhibition of Zinc Finger Protein 273 (ZNF273, Accession XM\_088082). Accordingly, utilities of VGAM500 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with ZNF273. LOC145934 (Accession XM\_096905) is another VGAM500 host target gene. LOC145934 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145934 BINDING SITE, designated SEQ ID:40626, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22748] Another function of VGAM500 is therefore inhibition of LOC145934 (Accession XM\_096905). Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145934. LOC256444 (Accession XM\_172937) is another VGAM500 host target gene. LOC256444 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256444 BINDING SITE, designated SEQ ID:46199, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22749] Another function of VGAM500 is therefore inhibition of LOC256444 (Accession XM\_172937). Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256444. LOC257484 (Accession XM\_114232) is another VGAM500 host target gene. LOC257484 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257484 BINDING SITE, designated SEQ ID:42815, to the nucleotide sequence of VGAM500 RNA, herein designated VGAM RNA, also designated SEQ ID:3211.

[22750] Another function of VGAM500 is therefore inhibition of LOC257484 (Accession XM\_114232). Accordingly, utilities of VGAM500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257484. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 501 (VGAM501) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22751] VGAM501 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM501 was detected is described hereinabove with reference to Figs. 1–8.

[22752] VGAM501 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carrot Mottle Mimic Virus. VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22753] VGAM501 gene encodes a VGAM501 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM501 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM501 precursor RNA is designated SEQ ID:487, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:487 is located at position 2430 relative to the genome of Carrot

## Mottle Mimic Virus.

[22754] VGAM501 precursor RNA folds onto itself, forming VGAM501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22755] An enzyme complex designated DICER COMPLEX, `dices` the VGAM501 folded precursor RNA into VGAM501 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM501 RNA is designated SEQ ID:3212, and is provided hereinbelow with reference to the sequence listing part.

[22756] VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM501 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[22757] VGAM501 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM501 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM501 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22758] The complementary binding of VGAM501 RNA, herein designated VGAM RNA, to host target binding sites on VGAM501 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM501 host target RNA into VGAM501 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22759] It is appreciated that VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM501 host target genes. The mRNA of each one of this plurality of VGAM501 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM501 RNA, herein designated VGAM RNA, and which when bound by VGAM501 RNA causes inhibition of translation of respective one or more VGAM501 host target proteins.

[22760] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM501 gene, herein designated VGAM GENE, on one or more VGAM501 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22761] It is yet further appreciated that a function of VGAM501 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of viral infection by Carrot Mottle Mimic Virus. Specific functions, and accordingly utilities, of VGAM501

correlate with, and may be deduced from, the identity of the host target genes which VGAM501 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22762] Nucleotide sequences of the VGAM501 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM501 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM501 are further described hereinbelow with reference to Table 1.

[22763] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM501 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM501 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22764] As mentioned hereinabove with reference to Fig. 1, a function of VGAM501 gene, herein designated VGAM is inhibition of expression of VGAM501 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM501 correlate with, and may be deduced

from, the identity of the target genes which VGAM501 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22765] Eukaryotic Translation Initiation Factor 4E Binding Protein 2 (EIF4EBP2, Accession NM\_004096) is a VGAM501 host target gene. EIF4EBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4EBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4EBP2 BINDING SITE, designated SEQ ID:10301, to the nucleotide sequence of VGAM501 RNA, herein designated VGAM RNA, also designated SEQ ID:3212.

[22766] A function of VGAM501 is therefore inhibition of Eukaryotic Translation Initiation Factor 4E Binding Protein 2 (EIF4EBP2, Accession NM\_004096), a gene which binds EIF4E and negatively regulates initiation of translation. Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4EBP2. The function of EIF4EBP2 has been established by previous studies. Pause et al. (1994) reported that the 4EBP2 gene encodes a 120-amino acid

polypeptide that is 56% identical to that of 4EBP1 (OMIM Ref. No. 602223). By Northern blot analysis, Tsukiyama-Kohara et al. (1996) showed that a major 3.5-kb transcript of 4EBP2 is expressed ubiquitously. Tsukiyama-Kohara et al. (1996) analyzed the genomic structure of the mouse EIF4EBP2 gene and showed that it consists of 3 exons and spans 20 kb. Its intron/exon structure is identical to that of EIF4EBP1. Using fluorescence in situ hybridization, Tsukiyama-Kohara et al. (1996) mapped the EIF4EBP2 gene to human chromosome 10q21-q22. They noted that chromosomal alterations in this region have been found in some human cancers. Tsukiyama-Kohara et al. (1996) mapped the mouse 4EBP2 gene to chromosome 10B4-B5.

[22767] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22768] Pause, A.; Belsham, G. J.; Gingras, A.-C.; Donze, O.; Lin, T.-A.; Lawrence, J. C., Jr.; Sonenberg, N. : Insulin-dependent stimulation of protein synthesis by phosphorylation of a regulator of 5-prime-cap function. *Nature* 371: 762-767, 1994. ; and

[22769] Tsukiyama-Kohara, K.; Vidal, S. M.; Gingras, A.-C.; Glover, T. W.; Hanash, S. M.; Heng, H.; Sonenberg, N. : Tissue dis-

tribution, genomic structure, and chromosome mapping of mouse and h.

[22770] Further studies establishing the function and utilities of EIF4EBP2 are found in John Hopkins OMIM database record ID 602224, and in cited publications numbered 346 and 6286 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Suppressor of Variegation 3-9 Homolog 1 (Drosophila) (SUV39H1, Accession NM\_003173) is another VGAM501 host target gene. SUV39H1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUV39H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUV39H1 BINDING SITE, designated SEQ ID:9147, to the nucleotide sequence of VGAM501 RNA, herein designated VGAM RNA, also designated SEQ ID:3212.

[22771] Another function of VGAM501 is therefore inhibition of Suppressor of Variegation 3-9 Homolog 1 (Drosophila) (SUV39H1, Accession NM\_003173), a gene which is homolog of Drosophila suppressor of variegation 3-9 and modifies position effect variegation. Accordingly, utilities

of VGAM501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H1. The function of SUV39H1 has been established by previous studies. By screening a human B-cell cDNA library with a sequence encoding the C-terminal portion of the *Drosophila* Su(var)3-9 gene product, which contains the SET domain, Aagaard et al. (1999) isolated a cDNA encoding SUV39H1. The predicted 412-amino acid SUV39H1 protein contains a chromodomain that is located close to the N terminus, a cysteine-rich region, an adjacent C-terminal SET domain that is followed at the very C-terminal tail by 3 conserved cysteine residues, and a putative nuclear localization signal. SUV39H1 shares 95% amino acid sequence identity with mouse Suv39h1, 42% identity with *Drosophila* Su(var)3-9, and 38% identity with *S. pombe* CLR4, another Su(var)3-9 ortholog. Immunoblot analysis of protein extracts from human cell lines detected an approximately 48-kD endogenous SUV39H1 protein, a mass that corresponds with the mass calculated from the SUV39H1 cDNA. Immunodetection of endogenous SUV39H1 protein revealed enriched distribution at heterochromatic foci during interphase and centromere-specific localization during metaphase. In addition, SUV39H1

protein associated with M31 (HP1-beta, or CBX1; 604511), an Su(var) homolog, indicating the existence of an Su(var) protein complex. Animal model experiments lend further support to the function of SUV39H1. Peters et al. (2001) generated mice deficient for either Suv39h1 or Suv39h2 (OMIM Ref. No. 606503). These animals displayed normal viability and fertility and did not exhibit apparent phenotypes. The authors subsequently intercrossed Suv39h1 -/- and Suv39h2 -/- mice to generate compound Suv39h mutants that were then used to derive Suv39h double-null mice (Suv39h1 -/- and Suv39h2 -/-). These mice displayed severely impaired viability and chromosomal instabilities that were associated with an increased tumor risk and perturbed chromosome interactions during male meiosis. These data suggested a crucial role for pericentric H3 histone-lys9 methylation in protecting genome stability and defined the Suv39h HMTases as important epigenetic regulators for mammalian development.

[22772] It is appreciated that the abovementioned animal model for SUV39H1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22773] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [22774] Aagaard, L.; Laible, G.; Selenko, P.; Schmid, M.; Dorn, R.; Schotta, G.; Kuhfittig, S.; Wolf, A.; Lebersorger, A.; Singh, P. EMBO J. 18: 1923-1938, 1999. ; and
- [22775] Peters, A. H. F. M.; O'Carroll, D.; Scherthan, H.; Mechtler, K.; Sauer, S.; Schofer, C.; Weipoltshammer, K.; Pagani, M.; Lachner, M.; Kohlmaier, A.; Opravil, S.; Doyle, M.; Sibilia, M.
- [22776] Further studies establishing the function and utilities of SUV39H1 are found in John Hopkins OMIM database record ID 300254, and in cited publications numbered 1244-124 and 9068-9073 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Claudin 8 (CLDN8, Accession NM\_012132) is another VGAM501 host target gene. CLDN8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN8 BINDING SITE, designated SEQ ID:14443, to the nucleotide sequence of VGAM501 RNA, herein designated VGAM RNA, also designated SEQ ID:3212.

[22777] Another function of VGAM501 is therefore inhibition of Claudin 8 (CLDN8, Accession NM\_012132). Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN8. FLJ11267 (Accession NM\_019607) is another VGAM501 host target gene. FLJ11267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11267 BINDING SITE, designated SEQ ID:21223, to the nucleotide sequence of VGAM501 RNA, herein designated VGAM RNA, also designated SEQ ID:3212.

[22778] Another function of VGAM501 is therefore inhibition of FLJ11267 (Accession NM\_019607). Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11267.

KIAA0090 (Accession XM\_114045) is another VGAM501 host target gene. KIAA0090 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42649, to the nucleotide sequence of VGAM501 RNA, herein designated VGAM RNA, also designated SEQ ID:3212.

[22779] Another function of VGAM501 is therefore inhibition of KIAA0090 (Accession XM\_114045). Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. LOC221687 (Accession XM\_166423) is another VGAM501 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44305, to the nucleotide sequence of VGAM501 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3212.

[22780] Another function of VGAM501 is therefore inhibition of LOC221687 (Accession XM\_166423). Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. LOC253769 (Accession XM\_173183) is another VGAM501 host target gene. LOC253769 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253769 BINDING SITE, designated SEQ ID:46429, to the nucleotide sequence of VGAM501 RNA, herein designated VGAM RNA, also designated SEQ ID:3212.

[22781] Another function of VGAM501 is therefore inhibition of LOC253769 (Accession XM\_173183). Accordingly, utilities of VGAM501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253769. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 502 (VGAM502) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22782] VGAM502 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM502 was detected is described hereinabove with reference to Figs. 1–8.

[22783] VGAM502 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Carrot Mottle Mimic Virus. VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22784] VGAM502 gene encodes a VGAM502 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM502 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM502 precursor RNA is designated SEQ ID:488, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:488 is located at position 2271 relative to the genome of Carrot Mottle Mimic Virus.

[22785] VGAM502 precursor RNA folds onto itself, forming

VGAM502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22786] An enzyme complex designated DICER COMPLEX, `dices` the VGAM502 folded precursor RNA into VGAM502 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM502 RNA is designated SEQ ID:3213, and is provided hereinbelow with reference to the sequence listing part.

[22787] VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM502 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22788] VGAM502 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM502 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM502 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22789] The complementary binding of VGAM502 RNA, herein designated VGAM RNA, to host target binding sites on VGAM502 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM502 host target RNA into VGAM502 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22790] It is appreciated that VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM502 host target genes. The mRNA of each one of this plurality of VGAM502 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM502 RNA, herein designated VGAM RNA, and which when bound by VGAM502 RNA causes inhibition of translation of respective one or more VGAM502 host target proteins.

[22791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM502 gene, herein designated VGAM GENE, on one or more VGAM502 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22792] It is yet further appreciated that a function of VGAM502 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM502 include diagnosis, prevention and treatment of viral infection by Carrot Mottle Mimic Virus. Specific functions, and accordingly utilities, of VGAM502 correlate with, and may be deduced from, the identity of the host target genes which VGAM502 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[22793] Nucleotide sequences of the VGAM502 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM502 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM502 are further described hereinbelow with reference to Table 1.

[22794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM502 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM502 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22795] As mentioned hereinabove with reference to Fig. 1, a function of VGAM502 gene, herein designated VGAM is inhibition of expression of VGAM502 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM502 correlate with, and may be deduced from, the identity of the target genes which VGAM502 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[22796] CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332) is a VGAM502 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27171, to the nucleotide sequence of VGAM502 RNA, herein designated VGAM RNA, also designated SEQ ID:3213.

[22797] A function of VGAM502 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332). Accordingly, utilities of VGAM502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM\_046054) is another VGAM502 host target gene. LHFPL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHFPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of LHFPL2 BINDING SITE, designated SEQ ID:34661, to the nucleotide sequence of VGAM502 RNA, herein designated VGAM RNA, also designated SEQ ID:3213.

[22798] Another function of VGAM502 is therefore inhibition of Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM\_046054). Accordingly, utilities of VGAM502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFPL2. LOC115343 (Accession XM\_050640) is another VGAM502 host target gene. LOC115343 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115343 BINDING SITE, designated SEQ ID:35665, to the nucleotide sequence of VGAM502 RNA, herein designated VGAM RNA, also designated SEQ ID:3213.

[22799] Another function of VGAM502 is therefore inhibition of LOC115343 (Accession XM\_050640). Accordingly, utilities of VGAM502 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC115343. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 503 (VGAM503) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22800] VGAM503 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM503 was detected is described hereinabove with reference to Figs. 1–8.

[22801] VGAM503 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22802] VGAM503 gene encodes a VGAM503 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM503 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM503 precursor RNA is designated SEQ

ID:489, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:489 is located at position 9956 relative to the genome of Mollusc Contagiosum Virus.

[22803] VGAM503 precursor RNA folds onto itself, forming VGAM503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22804] An enzyme complex designated DICER COMPLEX, `dices` the VGAM503 folded precursor RNA into VGAM503 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM503 RNA is designated SEQ ID:3214, and is provided hereinbelow with reference to the sequence

listing part.

[22805] VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM503 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22806] VGAM503 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM503 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM503 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22807] The complementary binding of VGAM503 RNA, herein designated VGAM RNA, to host target binding sites on VGAM503 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM503 host target RNA into VGAM503 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22808] It is appreciated that VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM503 host target genes. The mRNA of each one of this plurality of VGAM503 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM503 RNA, herein designated VGAM

RNA, and which when bound by VGAM503 RNA causes inhibition of translation of respective one or more VGAM503 host target proteins.

[22809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM503 gene, herein designated VGAM GENE, on one or more VGAM503 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22810] It is yet further appreciated that a function of VGAM503 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM503 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM503 correlate with, and may be deduced from, the identity of the host target genes which VGAM503 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22811] Nucleotide sequences of the VGAM503 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM503 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM503 are further described hereinbelow with reference to Table 1.

[22812] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM503 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM503 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22813] As mentioned hereinabove with reference to Fig. 1, a function of VGAM503 gene, herein designated VGAM is

inhibition of expression of VGAM503 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM503 correlate with, and may be deduced from, the identity of the target genes which VGAM503 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22814] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Accession NM\_006988) is a VGAM503 host target gene. ADAMTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS1 BINDING SITE, designated SEQ ID:13851, to the nucleotide sequence of VGAM503 RNA, herein designated VGAM RNA, also designated SEQ ID:3214.

[22815] A function of VGAM503 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Accession NM\_006988). Accordingly, utilities of VGAM503 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ADAMTS1. Frizzled Homolog 8 (Drosophila) (FZD8, Accession NM\_031866) is another VGAM503 host target gene. FZD8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD8 BINDING SITE, designated SEQ ID:25624, to the nucleotide sequence of VGAM503 RNA, herein designated VGAM RNA, also designated SEQ ID:3214.

[22816] Another function of VGAM503 is therefore inhibition of Frizzled Homolog 8 (Drosophila) (FZD8, Accession NM\_031866), a gene which may be involved in transduction and intercellular transmission of polarity information during tissue morphogenesis and/or in differentiated tissues. Accordingly, utilities of VGAM503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD8. The function of FZD8 has been established by previous studies. Drosophila cuticle hairs are arranged in a defined polarity that is genetically controlled by 'frizzled,' a 7-transmembrane receptor with a large extracellular N-terminal cysteine-rich domain

(CRD). Members of the FZD family are receptors for secreted WNT glycoproteins (see OMIM Ref. No. 602863), which are involved in developmental control. FZD proteins transmit signals through the beta-catenin (CTNNB1; 116806) or JNK (e.g., JNK3; 602897) pathways. The selection of intracellular signaling cascade may be determined by different C-terminal motifs in FZD proteins. By searching an EST database for sequences homologous to mouse Fzd8, followed by PCR, screening genomic DNA, brain cDNA, and fetal cDNA libraries, and RT-PCR on fetal kidney cDNA, Saitoh et al. (2001) isolated a cDNA encoding human FZD8. Sequence analysis predicted that the 694-amino acid protein, which is 69% identical to FZD5 (OMIM Ref. No. 601723) and 95% identical to mouse Fzd8, contains an N-terminal signal peptide, a CRD, 7 trans-membrane domains, 3 N-linked glycosylation sites, and a C-terminal ser/thr-X-val motif, which is a binding site for scaffold proteins with multiple PDZ domains. Northern blot analysis revealed expression of a 4.0-kb FZD8 transcript that was most abundant in fetal kidney, followed by fetal brain and fetal lung. In adult tissue, FZD8 was expressed in kidney, heart, pancreas, and skeletal muscle. Based on its high degree of identity to the mouse se-

quence, Saitoh et al. (2001) predicted that FZD8 may also activate the CTNNB1–TCF signaling pathway, like mouse Fzd8.

[22817] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22818] Saitoh, T.; Hirai, M.; Katoh, M. : Molecular cloning and characterization of human Frizzled–8 gene on chromosome 10p11.2. *Int. Oncol.* 18: 991–996, 2001. 3. Wang, Y.; Macke, J. P.; Abella, B. S.; Andreasson, K.; Worley, P.; Gilbert, D. J.; Copeland, N. G.; Jenkins, N. [22819] CREATION DATE.

[22820] Further studies establishing the function and utilities of FZD8 are found in John Hopkins OMIM database record ID 606146, and in cited publications numbered 6601 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin (Huntington disease) (HD, Accession NM\_002111) is another VGAM503 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA en-

coded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7895, to the nucleotide sequence of VGAM503 RNA, herein designated VGAM RNA, also designated SEQ ID:3214.

[22821] Another function of VGAM503 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM\_002111). Accordingly, utilities of VGAM503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM\_005431) is another VGAM503 host target gene. XRCC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XRCC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC2 BINDING SITE, designated SEQ ID:11903, to the nucleotide sequence of VGAM503 RNA, herein designated VGAM RNA, also designated SEQ ID:3214.

[22822] Another function of VGAM503 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM\_005431), a gene which involves in the homologous recombination repair (hrr) pathway of double-stranded dna. Accordingly, utilities of VGAM503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC2. The function of XRCC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM241. Chromosome 20 Open Reading Frame 59 (C20orf59, Accession NM\_022082) is another VGAM503 host target gene. C20orf59 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf59 BINDING SITE, designated SEQ ID:22626, to the nucleotide sequence of VGAM503 RNA, herein designated VGAM RNA, also designated SEQ ID:3214.

[22823] Another function of VGAM503 is therefore inhibition of Chromosome 20 Open Reading Frame 59 (C20orf59, Ac-

cession NM\_022082). Accordingly, utilities of VGAM503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf59. Tight Junction Protein 2 (zona occludens 2) (TJP2, Accession XM\_005446) is another VGAM503 host target gene. TJP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TJP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP2 BINDING SITE, designated SEQ ID:29980, to the nucleotide sequence of VGAM503 RNA, herein designated VGAM RNA, also designated SEQ ID:3214.

[22824] Another function of VGAM503 is therefore inhibition of Tight Junction Protein 2 (zona occludens 2) (TJP2, Accession XM\_005446). Accordingly, utilities of VGAM503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 504 (VGAM504) viral gene, which modulates expression of respective host target genes thereof, the function and utility

of which host target genes is known in the art.

[22825] VGAM504 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM504 was detected is described hereinabove with reference to Figs. 1–8.

[22826] VGAM504 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mollusum Contagiosum Virus. VGAM504 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22827] VGAM504 gene encodes a VGAM504 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM504 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM504 precursor RNA is designated SEQ ID:490, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:490 is located at position 49770 relative to the genome of Mollusum Contagiosum Virus.

[22828] VGAM504 precursor RNA folds onto itself, forming VGAM504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[22829] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM504 folded precursor RNA into VGAM504 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 70%) nucleotide se-  
quence of VGAM504 RNA is designated SEQ ID:3215, and  
is provided hereinbelow with reference to the sequence  
listing part.

[22830] VGAM504 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM504 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM504 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[22831] VGAM504 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM504 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM504 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[22832] The complementary binding of VGAM504 RNA, herein designated VGAM RNA, to host target binding sites on VGAM504 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM504 host target RNA into VGAM504 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22833] It is appreciated that VGAM504 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM504 host target genes. The mRNA of each one of this plurality of VGAM504 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM504 RNA, herein designated VGAM RNA, and which when bound by VGAM504 RNA causes inhibition of translation of respective one or more VGAM504 host target proteins.

[22834] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM504 gene, herein designated VGAM GENE, on one or

more VGAM504 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22835] It is yet further appreciated that a function of VGAM504 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM504 include diagnosis, prevention and treatment of viral infection by Molluscum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM504 correlate with, and may be deduced from, the identity of the host target genes which VGAM504 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22836] Nucleotide sequences of the VGAM504 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM504 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM504 are further described hereinbelow with reference to Table 1.

[22837] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM504 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM504 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22838] As mentioned hereinabove with reference to Fig. 1, a function of VGAM504 gene, herein designated VGAM is inhibition of expression of VGAM504 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM504 correlate with, and may be deduced from, the identity of the target genes which VGAM504 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22839] Nuclear Factor of Activated T-cells, Cytoplasmic, Cal-

calcineurin-dependent 1 (NFATC1, Accession NM\_006162) is a VGAM504 host target gene. NFATC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFATC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFATC1 BINDING SITE, designated SEQ ID:12816, to the nucleotide sequence of VGAM504 RNA, herein designated VGAM RNA, also designated SEQ ID:3215.

[22840] A function of VGAM504 is therefore inhibition of Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM\_006162), a gene which regulates the activation, proliferation, differentiation and programmed death of lymphoid and nonlymphoid cells. Accordingly, utilities of VGAM504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFATC1. The function of NFATC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM123. Transducin (beta)-like 2 (TBL2, Accession NM\_032988) is another VGAM504 host target gene. TBL2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by TBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL2 BINDING SITE, designated SEQ ID:26871, to the nucleotide sequence of VGAM504 RNA, herein designated VGAM RNA, also designated SEQ ID:3215.

[22841] Another function of VGAM504 is therefore inhibition of Transducin (beta)-like 2 (TBL2, Accession NM\_032988), a gene which is of unknown function. Accordingly, utilities of VGAM504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL2. The function of TBL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229.DKFZp586I021 (Accession NM\_032271) is another VGAM504 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DKFZp586I021 BINDING SITE, designated SEQ ID:26022, to the nucleotide sequence of VGAM504 RNA, herein designated VGAM RNA, also designated SEQ ID:3215.

[22842] Another function of VGAM504 is therefore inhibition of DKFZp586I021 (Accession NM\_032271). Accordingly, utilities of VGAM504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. FLJ22362 (Accession NM\_022823) is another VGAM504 host target gene. FLJ22362 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22362 BINDING SITE, designated SEQ ID:23104, to the nucleotide sequence of VGAM504 RNA, herein designated VGAM RNA, also designated SEQ ID:3215.

[22843] Another function of VGAM504 is therefore inhibition of FLJ22362 (Accession NM\_022823). Accordingly, utilities of VGAM504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22362. JM11 (Accession NM\_033626) is another VGAM504 host

target gene. JM11 BINDING SITE1 and JM11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JM11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE1 and JM11 BINDING SITE2, designated SEQ ID:27328 and SEQ ID:27329 respectively, to the nucleotide sequence of VGAM504 RNA, herein designated VGAM RNA, also designated SEQ ID:3215.

[22844] Another function of VGAM504 is therefore inhibition of JM11 (Accession NM\_033626). Accordingly, utilities of VGAM504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11. LOC96597 (Accession XM\_039922) is another VGAM504 host target gene. LOC96597 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33230, to the nucleotide sequence of VGAM504 RNA, herein designated VGAM RNA,

also designated SEQ ID:3215.

[22845] Another function of VGAM504 is therefore inhibition of LOC96597 (Accession XM\_039922). Accordingly, utilities of VGAM504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 505 (VGAM505) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22846] VGAM505 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM505 was detected is described hereinabove with reference to Figs. 1–8.

[22847] VGAM505 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22848] VGAM505 gene encodes a VGAM505 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM505 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM505 precursor RNA is designated SEQ ID:491, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:491 is located at position 106639 relative to the genome of Moluscum Contagiosum Virus.

[22849] VGAM505 precursor RNA folds onto itself, forming VGAM505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22850] An enzyme complex designated DICER COMPLEX, `dices` the VGAM505 folded precursor RNA into VGAM505 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM505 RNA is designated SEQ ID:3216, and is provided hereinbelow with reference to the sequence listing part.

[22851] VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM505 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22852] VGAM505 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM505 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM505 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22853] The complementary binding of VGAM505 RNA, herein designated VGAM RNA, to host target binding sites on VGAM505 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM505 host target RNA into VGAM505 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22854] It is appreciated that VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM505 host target genes. The mRNA of

each one of this plurality of VGAM505 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM505 RNA, herein designated VGAM RNA, and which when bound by VGAM505 RNA causes inhibition of translation of respective one or more VGAM505 host target proteins.

[22855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM505 gene, herein designated VGAM GENE, on one or more VGAM505 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[22856] It is yet further appreciated that a function of VGAM505 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM505 correlate with, and may be deduced from, the identity of the host target genes which VGAM505 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22857] Nucleotide sequences of the VGAM505 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM505 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM505 are further described hereinbelow with reference to Table 1.

[22858] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM505 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM505 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[22859] As mentioned hereinabove with reference to Fig. 1, a function of VGAM505 gene, herein designated VGAM is inhibition of expression of VGAM505 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM505 correlate with, and may be deduced from, the identity of the target genes which VGAM505 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22860] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM\_020038) is a VGAM505 host target gene. ABCC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC3 BINDING SITE, designated SEQ ID:21295, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22861] A function of VGAM505 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3

(ABCC3, Accession NM\_020038), a gene which may act as an inducible transporter in the biliary and intestinal excretion of organic anions. Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC3. The function of ABCC3 has been established by previous studies. Bile secretion in liver is driven in large part by ATP-binding cassette (ABC)-type proteins that reside in the canalicular membrane and effect ATP-dependent transport of bile acids, phospholipids, and non-bile acid organic anions. Canalicular ABC-type proteins can be classified into 2 subfamilies based on membrane topology and sequence identity: MDR1 (multidrug resistance-1; 171050), MDR3 (multidrug resistance-3; 171060), and SPGP (bile salt export pump, or sister of P-glycoprotein; 603201) resemble the multidrug resistance P-glycoprotein, whereas MRP2 (OMIM Ref. No. 601107) is similar in structure and sequence to the multidrug resistance protein MRP1 (OMIM Ref. No. 158343) and transports similar substrates. Kool et al. (1999) detected expression of ABCC3 in the lateral side of cholangiocytes and in the basolateral membranes of hepatocytes, where it mediates transport of S-glutathione. When expressed in

ovarian carcinoma cells, ABCC3 conferred resistance to the anticancer drugs methotrexate, etoposide, and teniposide. The authors noted that sequence analysis of ABCC3 predicts a protein organized in a way similar to ABCC1 and ABCC2. Using FISH, Uchiumi et al. (1998) mapped the ABCC3 gene to 17q22.

[22862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22863] Kool, M.; van der Linden, M.; de Haas, M.; Scheffer, G. L.; de Vree, J. M. L.; Smith, A. J.; Jansen, G.; Peters, G. J.; Ponne, N.; Scheper, R. J.; Oude Elferink, R. P. J.; Baas, F.; Borst, P. : MRP3, an organic anion transporter able to transport anti-cancer drugs. Proc. Nat. Acad. Sci. 96: 6914–6919, 1999. ; and

[22864] Uchiumi, T.; Hinoshita, E.; Haga, S.; Nakamura, T.; Tanaka, T.; Toh, S.; Furukawa, M.; Kawabe, T.; Wada, M.; Kagotani, K.; Okumura, K.; Kohno, K.; Akiyama, S.; Kuwano, M. : Isolation of.

[22865] Further studies establishing the function and utilities of ABCC3 are found in John Hopkins OMIM database record ID 604323, and in cited publications numbered 5013–501 and 7467 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. SH3-domain Binding Protein 4 (SH3BP4, Accession NM\_014521) is another VGAM505 host target gene. SH3BP4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SH3BP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:15856, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22866] Another function of VGAM505 is therefore inhibition of SH3-domain Binding Protein 4 (SH3BP4, Accession NM\_014521), a gene which is of unknown function, contains SH3-domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4. The function of SH3BP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Cofactor Required For Sp1 Transcriptional Acti-

vation, Subunit 3, 130kDa (CRSP3, Accession XM\_027112) is another VGAM505 host target gene. CRSP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRSP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRSP3 BINDING SITE, designated SEQ ID:30413, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22867] Another function of VGAM505 is therefore inhibition of Cofactor Required For Sp1 Transcriptional Activation, Subunit 3, 130kDa (CRSP3, Accession XM\_027112). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRSP3. Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665) is another VGAM505 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12211,

to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22868] Another function of VGAM505 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FLJ14888 (Accession NM\_032856) is another VGAM505 host target gene. FLJ14888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14888 BINDING SITE, designated SEQ ID:26657, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22869] Another function of VGAM505 is therefore inhibition of FLJ14888 (Accession NM\_032856). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14888. KIAA1058 (Accession XM\_090586) is another VGAM505 host target gene. KIAA1058 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1058 BINDING SITE, designated SEQ ID:40013, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22870] Another function of VGAM505 is therefore inhibition of KIAA1058 (Accession XM\_090586). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1058. NBR2 (Accession NM\_005821) is another VGAM505 host target gene. NBR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBR2 BINDING SITE, designated SEQ ID:12425, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22871] Another function of VGAM505 is therefore inhibition of

NBR2 (Accession NM\_005821). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBR2. PIP3-E (Accession XM\_039749) is another VGAM505 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33174, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22872] Another function of VGAM505 is therefore inhibition of PIP3-E (Accession XM\_039749). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. LOC158969 (Accession XM\_088728) is another VGAM505 host target gene. LOC158969 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC158969 BINDING SITE, designated SEQ ID:39923, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22873] Another function of VGAM505 is therefore inhibition of LOC158969 (Accession XM\_088728). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158969. LOC196510 (Accession XM\_113738) is another VGAM505 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:42396, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22874] Another function of VGAM505 is therefore inhibition of LOC196510 (Accession XM\_113738). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196510. LOC199986 (Accession XM\_117168) is an-

other VGAM505 host target gene. LOC199986 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199986 BINDING SITE, designated SEQ ID:43272, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22875] Another function of VGAM505 is therefore inhibition of LOC199986 (Accession XM\_117168). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199986. LOC200220 (Accession XM\_114157) is another VGAM505 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:42745, to the nucleotide sequence of VGAM505 RNA, herein designated VGAM RNA, also designated SEQ ID:3216.

[22876] Another function of VGAM505 is therefore inhibition of LOC200220 (Accession XM\_114157). Accordingly, utilities of VGAM505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200220. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 506 (VGAM506) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22877] VGAM506 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM506 was detected is described hereinabove with reference to Figs. 1–8.

[22878] VGAM506 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saguaro Cactus Virus. VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22879] VGAM506 gene encodes a VGAM506 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM506

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM506 precursor RNA is designated SEQ ID:492, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:492 is located at position 1711 relative to the genome of Saguaro Cactus Virus.

[22880] VGAM506 precursor RNA folds onto itself, forming VGAM506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM506 folded precursor RNA into VGAM506 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM506 RNA is designated SEQ ID:3217, and is provided hereinbelow with reference to the sequence listing part.

[22882] VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM506 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[22883] VGAM506 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM506 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM506 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22884] The complementary binding of VGAM506 RNA, herein designated VGAM RNA, to host target binding sites on VGAM506 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM506 host target RNA into VGAM506 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22885] It is appreciated that VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM506 host target genes. The mRNA of each one of this plurality of VGAM506 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM506 RNA, herein designated VGAM RNA, and which when bound by VGAM506 RNA causes inhibition of translation of respective one or more VGAM506 host target proteins.

[22886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM506 gene, herein designated VGAM GENE, on one or more VGAM506 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22887] It is yet further appreciated that a function of VGAM506 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM506 include diagnosis, prevention and treatment of viral infection by Saguaro Cactus Virus. Specific functions, and accordingly utilities, of VGAM506 correlate with, and may be deduced from, the identity of the host target genes which VGAM506 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22888] Nucleotide sequences of the VGAM506 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM506 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM506 are further described hereinbelow with reference to Table 1.

[22889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM506 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM506 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[22890] As mentioned hereinabove with reference to Fig. 1, a function of VGAM506 gene, herein designated VGAM is inhibition of expression of VGAM506 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM506 correlate with, and may be deduced from, the identity of the target genes which VGAM506 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22891] ADP-ribosyltransferase (NAD<sup>+</sup>; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM\_001618) is a VGAM506 host target gene. ADPRT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADPRT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADPRT BINDING SITE, designated SEQ ID:7323, to the nucleotide sequence of VGAM506 RNA, herein designated VGAM RNA, also designated SEQ ID:3217.

[22892] A function of VGAM506 is therefore inhibition of ADP-ribosyltransferase (NAD<sup>+</sup>; poly (ADP-ribose) Polymerase) (ADPRT, Accession NM\_001618), a gene which catalyzes

addition of mono-ADP-ribose to arginine residues of proteins, inhibits Pol II transcription. Accordingly, utilities of VGAM506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADPRT. The function of ADPRT has been established by previous studies. The chromatin-associated enzyme poly(ADP-ribose) polymerase (ADPRT; EC 2.4.2.30) is a 116-kD protein that uses NAD as substrate to catalyze both the covalent transfer of ADP-ribose to a variety of nuclear protein acceptors and subsequently the transfer of an additional 60 to 80 ADP-ribose units to the initial moiety. Nuclear proteins that become predominantly poly(ADP-ribosyl)ated include nucleosomal core histones, histone H1 (see OMIM Ref. No. 142711), HMG proteins (see OMIM Ref. No. 163910), and topoisomerases I (OMIM Ref. No. 126420) and II (see OMIM Ref. No. 126430). ADP ribosyltransferase is required for cellular repair. Inhibitors of this enzyme potentiate the lethal effects of noxious agents. During repair, NAD(+) is consumed and the NAD(+) content of the cell decreases. Concomitantly, nuclear proteins are ADP-ribosylated. The enzyme is induced by single-strand breaks in DNA which serve as co-substrate for the reaction. Yu et al. (2002) demonstrated

that PARP1 activation is required for translocation of apoptosis-inducing factor (AIF; 300169) from the mitochondria to the nucleus and that AIF is necessary for PARP1-dependent cell death. N-methyl-N-prime-nitro-N-nitrosoguanidine, hydrogen peroxide, and NMDA induce AIF translocation and cell death, which is prevented by PARP inhibitors or genetic knockout of PARP1, but is caspase independent. Microinjection of an antibody to AIF protects against PARP1-dependent cytotoxicity. Yu et al. (2002) concluded that their data support a model in which PARP1 activation signals AIF release from mitochondria, resulting in a caspase-independent pathway of programmed cell death. Animal model experiments lend further support to the function of ADPRT. . Pieper et al. (1999) demonstrated DNA damage and a major activation of PARP in pancreatic islets of STZ-treated mice. These mice displayed a 5-fold increase in blood glucose and major pancreatic islet damage.

[22893] It is appreciated that the abovementioned animal model for ADPRT is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22894] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22895] Yu, S.-W.; Wang, H.; Poitras, M. F.; Coombs, C.; Bowers, W. J.; Federoff, H. J.; Poirier, G. G.; Dawson, T. M.; Dawson, V. L. : Mediation of poly(ADP-ribose) polymerase-1-dependent cell death by apoptosis-inducing factor. Science 297: 259-263, 2002. ; and

[22896] Pieper, A. A.; Brat, D. J.; Krug, D. K.; Watkins, C. C.; Gupta, A.; Blackshaw, S.; Verma, A.; Wang, Z.-Q.; Snyder, S. H. : Poly(ADP-ribose) polymerase-deficient mice are protected from.

[22897] Further studies establishing the function and utilities of ADPRT are found in John Hopkins OMIM database record ID 173870, and in cited publications numbered 1772-1774, 1778-1777, 1779-1791, 2124, 420 and 10258-10261 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibrinogen, A Alpha Polypeptide (FGA, Accession NM\_000508) is another VGAM506 host target gene. FGA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGA, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGA BINDING SITE, designated SEQ ID:6120, to the nucleotide sequence of VGAM506 RNA, herein designated VGAM RNA, also designated SEQ ID:3217.

[22898] Another function of VGAM506 is therefore inhibition of Fibrinogen, A Alpha Polypeptide (FGA, Accession NM\_000508). Accordingly, utilities of VGAM506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGA. KIAA0993 (Accession XM\_034413) is another VGAM506 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32079, to the nucleotide sequence of VGAM506 RNA, herein designated VGAM RNA, also designated SEQ ID:3217.

[22899] Another function of VGAM506 is therefore inhibition of KIAA0993 (Accession XM\_034413). Accordingly, utilities of VGAM506 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0993. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 507 (VGAM507) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22900] VGAM507 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM507 was detected is described hereinabove with reference to Figs. 1–8.

[22901] VGAM507 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saguaro Cactus Virus. VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22902] VGAM507 gene encodes a VGAM507 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM507 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM507 precursor RNA is designated SEQ

ID:493, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:493 is located at position 2130 relative to the genome of Saguaro Cactus Virus.

[22903] VGAM507 precursor RNA folds onto itself, forming VGAM507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22904] An enzyme complex designated DICER COMPLEX, `dices` the VGAM507 folded precursor RNA into VGAM507 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM507 RNA is designated SEQ ID:3218, and is provided hereinbelow with reference to the sequence

listing part.

[22905] VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM507 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22906] VGAM507 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM507 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM507 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22907] The complementary binding of VGAM507 RNA, herein designated VGAM RNA, to host target binding sites on VGAM507 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM507 host target RNA into VGAM507 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22908] It is appreciated that VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM507 host target genes. The mRNA of each one of this plurality of VGAM507 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM507 RNA, herein designated VGAM

RNA, and which when bound by VGAM507 RNA causes inhibition of translation of respective one or more VGAM507 host target proteins.

[22909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM507 gene, herein designated VGAM GENE, on one or more VGAM507 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22910] It is yet further appreciated that a function of VGAM507 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM507 include diagnosis, prevention and treatment of viral infection by Saguaro Cactus Virus. Specific functions, and accordingly utilities, of VGAM507 correlate with, and may be deduced from, the identity of the host target genes which VGAM507 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22911] Nucleotide sequences of the VGAM507 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM507 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM507 are further described hereinbelow with reference to Table 1.

[22912] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM507 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM507 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22913] As mentioned hereinabove with reference to Fig. 1, a function of VGAM507 gene, herein designated VGAM is

inhibition of expression of VGAM507 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM507 correlate with, and may be deduced from, the identity of the target genes which VGAM507 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22914] Chromosome 20 Open Reading Frame 126 (C20orf126, Accession NM\_030815) is a VGAM507 host target gene. C20orf126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf126 BINDING SITE, designated SEQ ID:25133, to the nucleotide sequence of VGAM507 RNA, herein designated VGAM RNA, also designated SEQ ID:3218.

[22915] A function of VGAM507 is therefore inhibition of Chromosome 20 Open Reading Frame 126 (C20orf126, Accession NM\_030815). Accordingly, utilities of VGAM507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf126. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Ac-

cession NM\_003559) is another VGAM507 host target gene. PIP5K2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE, designated SEQ ID:9615, to the nucleotide sequence of VGAM507 RNA, herein designated VGAM RNA, also designated SEQ ID:3218.

[22916] Another function of VGAM507 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM\_003559). Accordingly, utilities of VGAM507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM\_016353) is another VGAM507 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ

ID:18484, to the nucleotide sequence of VGAM507 RNA, herein designated VGAM RNA, also designated SEQ ID:3218.

[22917] Another function of VGAM507 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM\_016353). Accordingly, utilities of VGAM507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC150142 (Accession XM\_086791) is another VGAM507 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38848, to the nucleotide sequence of VGAM507 RNA, herein designated VGAM RNA, also designated SEQ ID:3218.

[22918] Another function of VGAM507 is therefore inhibition of LOC150142 (Accession XM\_086791). Accordingly, utilities of VGAM507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC219988 (Accession XM\_166223) is an-

other VGAM507 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:44046, to the nucleotide sequence of VGAM507 RNA, herein designated VGAM RNA, also designated SEQ ID:3218.

[22919] Another function of VGAM507 is therefore inhibition of LOC219988 (Accession XM\_166223). Accordingly, utilities of VGAM507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 508 (VGAM508) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22920] VGAM508 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM508 was detected is described

hereinabove with reference to Figs. 1–8.

[22921] VGAM508 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saguaro Cactus Virus. VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22922] VGAM508 gene encodes a VGAM508 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM508 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM508 precursor RNA is designated SEQ ID:494, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:494 is located at position 1022 relative to the genome of Saguaro Cactus Virus.

[22923] VGAM508 precursor RNA folds onto itself, forming VGAM508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22924] An enzyme complex designated DICER COMPLEX, `dices` the VGAM508 folded precursor RNA into VGAM508 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM508 RNA is designated SEQ ID:3219, and is provided hereinbelow with reference to the sequence listing part.

[22925] VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM508 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22926] VGAM508 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM508 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM508 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM508 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22927] The complementary binding of VGAM508 RNA, herein designated VGAM RNA, to host target binding sites on VGAM508 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM508 host target RNA into VGAM508 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22928] It is appreciated that VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM508 host target genes. The mRNA of each one of this plurality of VGAM508 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM508 RNA, herein designated VGAM RNA, and which when bound by VGAM508 RNA causes inhibition of translation of respective one or more VGAM508 host target proteins.

[22929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM508 gene, herein designated VGAM GENE, on one or more VGAM508 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22930] It is yet further appreciated that a function of VGAM508 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of viral infection by Saguaro Cactus Virus. Specific functions, and accordingly utilities, of VGAM508 correlate with, and may be deduced from, the identity of the host target genes which VGAM508 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22931] Nucleotide sequences of the VGAM508 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM508 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM508 are further described hereinbelow with reference to Table 1.

[22932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM508 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM508 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22933] As mentioned hereinabove with reference to Fig. 1, a function of VGAM508 gene, herein designated VGAM is inhibition of expression of VGAM508 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM508 correlate with, and may be deduced from, the identity of the target genes which VGAM508 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22934] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Accession NM\_014243) is a VGAM508 host target gene. ADAMTS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ADAMTS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS3 BINDING SITE, designated SEQ ID:15508, to the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, also designated SEQ ID:3219.

[22935] A function of VGAM508 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Accession NM\_014243), a gene which cleaves the propeptides of type ii collagen prior to fibril assembly. Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS3. The function of ADAMTS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM211. Carbonic Anhydrase XII (CA12, Accession NM\_001218) is another VGAM508 host target gene. CA12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CA12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CA12 BINDING SITE, designated SEQ ID:6877, to the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, also designated SEQ ID:3219.

[22936] Another function of VGAM508 is therefore inhibition of Carbonic Anhydrase XII (CA12, Accession NM\_001218), a gene which functions in cellular transport and metabolic processes. Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA12. The function of CA12 has been established by previous studies. Tureci et al. (1998) cloned the gene identified by Sahin et al. (1995) from the RCC and named it CA XII. The cDNA sequence encodes a deduced 354-amino acid protein with a predicted molecular mass of 39,448 Da and features of a type I membrane protein. The extracellular CA domain shows 30 to 42% similarity with known human CAs, contains all 3 zinc-binding histidine residues found in active CAs, and contains 2 potential sites for asparagine glycosylation. Expression of the CA XII cDNA in mammalian cells produced a 43- to 44-kD doublet; treatment with PNGase (endoglycosidase) F resulted in a single 39-kD

product. The recombinant CA XII had appreciable catalytic activity. By Northern blot analysis, the authors detected a 4.5-kb CA XII transcript in normal human kidney, colon, and activated lymphocytes. They found that CA XII is overexpressed in 10% of clear cell renal carcinomas, as compared with the corresponding normal renal tissue. Sequencing revealed no differences between the RCC-derived cDNA and a CA XII cDNA isolated from normal kidney. Carbonic anhydrases (CAs) are a family of zinc metalloenzymes. For background information on the CA family,

[22937] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

schuh, M. : Human neoplasms elicit multiple specific immune resp.

[22940] Further studies establishing the function and utilities of CA12 are found in John Hopkins OMIM database record ID 603263, and in cited publications numbered 269 and 6327–6328 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM\_000103) is another VGAM508 host target gene. CYP19 BINDING SITE1 and CYP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP19 BINDING SITE1 and CYP19 BINDING SITE2, designated SEQ ID:5559 and SEQ ID:25269 respectively, to the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, also designated SEQ ID:3219.

[22941] Another function of VGAM508 is therefore inhibition of Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM\_000103), a gene which cat-

analyzes the last steps of estrogen biosynthesis. Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19. The function of CYP19 has been established by previous studies. The distinct gender-specific patterns of fat distribution in men and women (android and gynoid) suggest a role for sex steroids. It has been suggested that estrogens can promote preadipocyte cell proliferation and/or differentiation. The enzyme CYP19 is responsible for the conversion of androgen precursor steroids to estrogens and may, therefore, have a role in regulating adipose tissue mass and its distribution. McTernan et al. (2002) investigated the glucocorticoid regulation of aromatase expression in adipose tissue, specifically to define any site- and gender-specific differences. Abdominal subcutaneous and omental adipose tissue was obtained from male and female patients undergoing elective surgery. Cortisol-induced aromatase activity in omental adipocytes from postmenopausal females was higher than that in premenopausal females ( $P$  less than 0.001). Insulin had no independent effect on aromatase expression, but coincubation of preadipocytes with cortisol and insulin eliminated both gender- and site-specific differ-

ences. The authors concluded that in women, but not men, cortisol increases aromatase activity at subcutaneous sites, and this may facilitate predilection for subcutaneous adiposity in females. They suggested that the observed site-, gender-, and menopausal-specific differences in the glucocorticoid regulation of this enzyme may contribute to the gender- and menopausal-specific patterns of fat distribution. Hemsell et al. (1977) reported a case of gynecomastia apparently due to excessive peripheral conversion of androgen to estrogen as a result of 50-times-normal aromatase activity. The patient was an adopted boy, aged 11 years 7 months. Effects of excessive estrogen became evident at age 8, the time when plasma androstenedione begins to increase. Extraglandular aromatization, as well as sulfurylation, is extensively involved in C19-steroid metabolism in the fetus, but the activity of the enzymes falls rapidly after birth. In the patient of Hemsell et al. (1977), the fetal situation appeared to persist. Berkovitz et al. (1985) investigated a black family in which marked gynecomastia with normal male genitalia occurred in 5 men in 3 sibships of 2 generations connected through females. In each, gynecomastia and male sexual differentiation began at an early age (10 to 11

years). The ratio of the concentration of plasma estradiol-17 beta to that of plasma testosterone was elevated in each. In 3 affected sibs, the transfer constant of conversion of androstenedione to estrone (i.e., the fraction of plasma androstenedione that was converted to estrone as measured in the urine) was 10 times the normal. Despite elevated extraglandular aromatase activity, the hypothalamic-pituitary axis responded normally to provocative stimuli. None of the 5 males had children, but 4 were still in their teens; the fifth was 29 years of age. The pattern of inheritance of familial gynecomastia with increased aromatase activity is consistent with either X-linked recessive or autosomal dominant, male-limited inheritance. Mapping of the aromatase locus to an autosome makes the latter possibility highly likely. Autosomal dominant inheritance appeared likely in a family, reported by Leiberman and Zachmann (1992), in which increased steroid aromatization seemed to be responsible for 'familial adrenal feminization.' The father and 2 male and 2 female sibs had gynecomastia, early growth, and short final stature. The 8-year-old propositus had advanced bone age, facial acne, gynecomastia, pubic hair, and prepubertal testicular volume. ACTH-dependent adrenal feminization was con-

firmed by a transient reduction of breast tissue following dexamethasone or cyproterone acetate treatment.

Testolactone, which is an inhibitor of peripheral aromatase activity in vivo, temporarily reduced the breast tissue. This was the first example of male-to-male and male-to-female transmission reported. Animal model experiments lend further support to the function of CYP19.

Aromatase knockout (ArKO) mice, lacking a functional Cyp19 gene, cannot synthesize endogenous estrogens.

Jones et al. (2000) examined the adipose deposits of male and female ArKO mice, observing that these animals progressively accumulated significantly more intraabdominal adipose tissue than their wildtype littermates, reflected in increased adipocyte volume at gonadal and infrarenal sites. This increased adiposity was not due to hyperphagia or reduced resting energy expenditure, but was associated with reduced spontaneous physical activity levels, reduced glucose oxidation, and a decrease in lean body mass. A striking accumulation of lipid droplets was observed in the livers of ArKO animals. The findings demonstrated an important role for estrogen in the maintenance of lipid homeostasis in both males and females. Along the same lines, Heine et al. (2000) studied male and female

Esr1 knockout mice and found that signaling by this receptor is critical in female and male white adipose tissue. Obesity in the males involved a mechanism of reduced energy expenditure rather than increased energy intake.

[22942] It is appreciated that the abovementioned animal model for CYP19 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[22943] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22944] Deladoey, J.; Fluck, C.; Bex, M.; Yoshimura, N.; Harada, N.; Mullis, P. E. : Aromatase deficiency caused by a novel P450(arom) gene mutation: impact of absent estrogen production on serum gonadotropin concentration in a boy. J. Clin. Endocr. Metab. 84: 4050–4054, 1999. ; and

[22945] Yang, S.; Fang, Z.; Suzuki, T.; Sasano, H.; Zhou, J.; Gurates, B.; Tamura, M.; Ferrer, K.; Bulun, S. : Regulation of aromatase P450 expression in endometriotic and endometrial stromal.

[22946] Further studies establishing the function and utilities of CYP19 are found in John Hopkins OMIM database record ID 107910, and in cited publications numbered 4675,

4845, 4855–4869, 2149, 4870–4871, 877, 4872–4881, 29, 12529–12530, 313 and 12531–12535 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM\_000450) is another VGAM508 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:6051, to the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, also designated SEQ ID:3219.

[22947] Another function of VGAM508 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM\_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE has been established by previous studies. Zheng et al. (2001) examined whether a polymorphism in the SELE gene, due

to a G-to-T mutation (98G-T) in the untranslated region of exon 2, was related to premature coronary artery disease (CAD). Both lipid and nonlipid risk factors, including the ser128-to-arg substitution studied by Wenzel et al. (1994), were also assessed. The frequency of the 98G-T mutation was found to be significantly increased among male patients under 45 years of age and female patients under 55 years of age. After controlling for other CAD risk factors by multiple logistic analysis, the 98G-T mutation was still a significant predictor of premature CAD. The glaucomas are a group of optic neuropathies comprising the leading cause of irreversible blindness worldwide. Elevated intraocular pressure due to a reduction in normal aqueous outflow is a major causal risk factor. Wang et al. (2001) found that ELAM1, the earliest marker for the atherosclerotic plaque in the vasculature, was consistently present on trabecular meshwork cells in the outflow pathways of eyes with glaucomas of diverse etiology. They determined expression of ELAM1 to be controlled by activation of an interleukin-1 (see OMIM Ref. No. 147760) autocrine feedback loop through transcription factor NK-kappa-B (see OMIM Ref. No. 164011), and activity of this signaling pathway was shown to protect trabecular mesh-

work cells against oxidative stress. Wang et al. (2001) concluded that their findings characterized a protective stress response specific to the eye's aqueous outflow pathways and provided the first known diagnostic indicator of glaucomatous trabecular meshwork cells. They further indicated that common mechanisms contribute to the pathophysiology of the glaucomas and vascular diseases.

[22948] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22949] Wang, N.; Chintala, S. K.; Fini, M. E.; Schuman, J. S. : Activation of a tissue-specific stress response in the aqueous outflow pathway of the eye defines the glaucoma disease phenotype. *Nature Med.* 7: 304–309, 2001. ; and

[22950] Zheng, F.; Chevalier, J. A.; Zhang, L. Q.; Virgil, D.; Ye, S. Q.; Kwiterovich, P. O. : An HphI polymorphism in the E-selectin gene is associated with premature coronary artery diseases.

[22951] Further studies establishing the function and utilities of SELE are found in John Hopkins OMIM database record ID 131210, and in cited publications numbered 11805–11812 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.FLJ21945 (Accession NM\_025203) is another VGAM508 host target gene. FLJ21945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21945 BINDING SITE, designated SEQ ID:24866, to the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, also designated SEQ ID:3219.

[22952] Another function of VGAM508 is therefore inhibition of FLJ21945 (Accession NM\_025203). Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21945. Heterogeneous Nuclear Ribonucleoprotein U (scaffold attachment factor A) (HNRPU, Accession NM\_031844) is another VGAM508 host target gene. HNRPU BINDING SITE1 and HNRPU BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPU, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPU BINDING SITE1 and HNRPU BINDING

SITE2, designated SEQ ID:25579 and SEQ ID:10835 respectively, to the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, also designated SEQ ID:3219.

[22953] Another function of VGAM508 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein U (scaffold attachment factor A) (HNRPU, Accession NM\_031844). Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPU. LOC91266 (Accession XM\_037268) is another VGAM508 host target gene. LOC91266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:32600, to the nucleotide sequence of VGAM508 RNA, herein designated VGAM RNA, also designated SEQ ID:3219.

[22954] Another function of VGAM508 is therefore inhibition of LOC91266 (Accession XM\_037268). Accordingly, utilities of VGAM508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 509 (VGAM509) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22955] VGAM509 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM509 was detected is described hereinabove with reference to Figs. 1–8.

[22956] VGAM509 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Papaya Ringspot Virus. VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22957] VGAM509 gene encodes a VGAM509 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM509 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM509 precursor RNA is designated SEQ ID:495, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:495 is located at position 7642 relative to the genome of Papaya Ringspot Virus.

[22958] VGAM509 precursor RNA folds onto itself, forming VGAM509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22959] An enzyme complex designated DICER COMPLEX, `dices` the VGAM509 folded precursor RNA into VGAM509 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM509 RNA is designated SEQ ID:3220, and is provided hereinbelow with reference to the sequence listing part.

[22960] VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM509 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[22961] VGAM509 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM509 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM509 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[22962] The complementary binding of VGAM509 RNA, herein designated VGAM RNA, to host target binding sites on VGAM509 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM509 host target RNA into VGAM509 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22963] It is appreciated that VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM509 host target genes. The mRNA of each one of this plurality of VGAM509 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM509 RNA, herein designated VGAM RNA, and which when bound by VGAM509 RNA causes in-

hibition of translation of respective one or more VGAM509 host target proteins.

[22964] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM509 gene, herein designated VGAM GENE, on one or more VGAM509 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22965] It is yet further appreciated that a function of VGAM509 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM509 include diagnosis, prevention and

treatment of viral infection by Papaya Ringspot Virus. Specific functions, and accordingly utilities, of VGAM509 correlate with, and may be deduced from, the identity of the host target genes which VGAM509 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[22966] Nucleotide sequences of the VGAM509 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM509 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM509 are further described hereinbelow with reference to Table 1.

[22967] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM509 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM509 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22968] As mentioned hereinabove with reference to Fig. 1, a function of VGAM509 gene, herein designated VGAM is inhibition of expression of VGAM509 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM509 correlate with, and may be deduced from, the identity of the target genes which VGAM509 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[22969] Cystinosis, Nephropathic (CTNS, Accession NM\_004937) is a VGAM509 host target gene. CTNS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNS BINDING SITE, designated SEQ ID:11382, to the nucleotide sequence of VGAM509 RNA, herein designated VGAM RNA, also designated SEQ ID:3220.

[22970] A function of VGAM509 is therefore inhibition of Cystinosis, Nephropathic (CTNS, Accession NM\_004937). Accordingly, utilities of VGAM509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNS. Mannosyl (alpha-1,6)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408) is another VGAM509 host target gene. MGAT2 BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by MGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT2 BINDING SITE, designated SEQ ID:8231, to the nucleotide sequence of VGAM509 RNA, herein designated VGAM RNA, also designated SEQ ID:3220.

[22971] Another function of VGAM509 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408). Accordingly, utilities of VGAM509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT2. HT001 (Accession XM\_039534) is another VGAM509 host target gene. HT001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HT001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT001 BINDING SITE, designated SEQ ID:33115, to the nucleotide sequence of VGAM509 RNA, herein designated VGAM RNA, also designated SEQ

ID:3220.

[22972] Another function of VGAM509 is therefore inhibition of HT001 (Accession XM\_039534). Accordingly, utilities of VGAM509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT001. Zinc Finger Protein 226 (ZNF226, Accession NM\_016444) is another VGAM509 host target gene. ZNF226 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF226 BINDING SITE, designated SEQ ID:18565, to the nucleotide sequence of VGAM509 RNA, herein designated VGAM RNA, also designated SEQ ID:3220.

[22973] Another function of VGAM509 is therefore inhibition of Zinc Finger Protein 226 (ZNF226, Accession NM\_016444). Accordingly, utilities of VGAM509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF226. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 510 (VGAM510) viral gene,

which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[22974] VGAM510 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM510 was detected is described hereinabove with reference to Figs. 1–8.

[22975] VGAM510 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Papaya Ringspot Virus. VGAM510 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[22976] VGAM510 gene encodes a VGAM510 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM510 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM510 precursor RNA is designated SEQ ID:496, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:496 is located at position 4216 relative to the genome of Papaya Ringspot Virus.

[22977] VGAM510 precursor RNA folds onto itself, forming

VGAM510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[22978] An enzyme complex designated DICER COMPLEX, `dices` the VGAM510 folded precursor RNA into VGAM510 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM510 RNA is designated SEQ ID:3221, and is provided hereinbelow with reference to the sequence listing part.

[22979] VGAM510 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM510 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[22980] VGAM510 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM510 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM510 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[22981] The complementary binding of VGAM510 RNA, herein designated VGAM RNA, to host target binding sites on VGAM510 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM510 host target RNA into VGAM510 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[22982] It is appreciated that VGAM510 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM510 host target genes. The mRNA of each one of this plurality of VGAM510 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM510 RNA, herein designated VGAM RNA, and which when bound by VGAM510 RNA causes inhibition of translation of respective one or more VGAM510 host target proteins.

[22983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM510 gene, herein designated VGAM GENE, on one or more VGAM510 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[22984] It is yet further appreciated that a function of VGAM510 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of viral infection by Papaya Ringspot Virus. Specific functions, and accordingly utilities, of VGAM510 correlate with, and may be deduced from, the identity of the host target genes which VGAM510 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[22985] Nucleotide sequences of the VGAM510 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM510 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM510 are further described hereinbelow with reference to Table 1.

[22986] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM510 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM510 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[22987] As mentioned hereinabove with reference to Fig. 1, a function of VGAM510 gene, herein designated VGAM is inhibition of expression of VGAM510 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM510 correlate with, and may be deduced from, the identity of the target genes which VGAM510 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[22988] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898) is a VGAM510 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23157, to the nucleotide sequence of VGAM510 RNA, herein designated VGAM RNA, also designated SEQ ID:3221.

[22989] A function of VGAM510 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898). Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Empty Spiracles Homolog 2 (Drosophila) (EMX2, Accession XM\_113640) is another VGAM510 host target gene. EMX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of EMX2 BINDING SITE, designated SEQ ID:42315, to the nucleotide sequence of VGAM510 RNA, herein designated VGAM RNA, also designated SEQ ID:3221.

[22990] Another function of VGAM510 is therefore inhibition of Empty Spiracles Homolog 2 (Drosophila) (EMX2, Accession XM\_113640), a gene which may function in combinations with otx1/2 to specify cell fates in the developing central nervous system. Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMX2. The function of EMX2 has been established by previous studies. Brunelli et al. (1996) described schizencephaly (OMIM Ref. No. 269160) as an extremely rare congenital disorder characterized by a full-thickness cleft within the cerebral hemispheres. The clefts are lined with gray matter and most commonly involve the parasylvian regions (Wolpert and Barnes, 1992). Large portions of the cerebral hemispheres may be absent and replaced by cerebrospinal fluid. In a search for mutations in the human homologs of the Emx1, Emx2, Otx1, and Otx2 genes, which are expressed in the developing mouse forebrain, Brunelli et al. (1996) found that 3 of 8 patients with severe schizencephaly were het-

erozygous for different mutations in the EMX2 gene. One of the mutations was a frameshift in the homeodomain resulting in the alteration of its carboxy terminus, including the entire recognition helix. The other 2 were 3-prime splice site mutations in the first intron, upstream from the homeodomain, which prevented appropriate splicing of EMX2 transcripts in vitro. All 3 were de novo mutations, as they were not present in the patients' parents. Thus, the authors concluded that the EMX2 protein appears to be required for the correct formation of the human cerebral cortex. Two types of schizencephaly have been described, depending on the size of the area involved and the separation of the cleft lips (Wolpert and Barnes, 1992). Type I schizencephaly consists of a fused cleft. This fused pial-apendymal seam forms a furrow in the developing brain, and is lined by polymicrogyric gray matter. In type II schizencephaly, there is a large defect, a holohemispheric cleft in the cerebral cortex filled with fluid and lined by polymicrogyric gray matter. The clinical manifestations depend on the severity of the lesion. Patients with type I are often almost normal; they may have seizures and spasticity. In type II abnormalities, there is usually mental retardation, seizures, hypotonia, spasticity, inability to

walk or speak, and blindness. The patients in whom Brunelli et al. (1996) demonstrated EMX2 mutations belonged to the type II category. The authors speculated that EMX2 may play a part in the control of cell proliferation of cortical neuroblasts and/or cell migration of postmitotic neurons, as it is known that these cells reach their final destination in the mature cortex according to their birth date (Boncinelli et al., 1995). Patients with mild forms of schizencephaly are often almost normal but may show partial epileptic seizures and mild spastic hemiparesis. Conversely, patients with bilateral open-lip clefts usually have microcephaly, severe developmental delay with serious mental retardation, and spastic quadriparesis. Adding to the previously reported analysis of EMX2 mutations in 7 of 8 sporadic cases of schizencephaly, Faiella et al. (1997) analyzed 10 additional patients, including 2 brothers. Six patients were found to be heterozygous for de novo mutations in EMX2. In particular, the 2 brothers, who had severe bilateral schizencephaly, showed the same mutation affecting the splicing of the first intron, while this mutation was absent in their parents and in 2 unaffected sibs. Presumably this was an instance of germinal mosaicism in one or the other of the parents. Some other patients with

mutations had mild unilateral schizencephaly associated with partial epilepsy. Mutation analysis by Noonan et al. (2001) of endometrioid adenocarcinomas and a Mullerian mesodermal tumor identified multiple variants in the EMX2 gene, including somatic mutations not found in normal DNA, intronic polymorphisms present in normal DNA samples, and polymorphisms in the 3-prime untranslated region. Noonan et al. (2001) concluded that EMX2 is most likely involved in the control of differentiation and possibly in tumor suppression. Animal model experiments lend further support to the function of EMX2. The contribution of extrinsic and genetic mechanisms in determining areas of the mammalian neocortex has been a contested issue. Bishop et al. (2000) analyzed the roles of the regulatory genes Emx2 and Pax6 (OMIM Ref. No. 607108), which are expressed in opposing gradients in the neocortical ventricular zone, in specifying areas. Changes in the patterning of molecular markers and area-specific connections between the cortex and thalamus suggested that arealization of the neocortex is disproportionately altered in Emx2 and Pax6 mutant mice in opposing manners predicted from their countergradients of expression: rostral areas expanded and caudal areas con-

tracted in Emx2 mutants, whereas the opposite effect was seen in Pax6 mutants. Bishop et al. (2000) concluded that Emx2 and Pax6 cooperate to regulate arealization of the neocortex and to confer area identity to cortical cells.

[22991] It is appreciated that the abovementioned animal model for EMX2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[22992] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[22995] Further studies establishing the function and utilities of EMX2 are found in John Hopkins OMIM database record ID 600035, and in sited publications numbered 8112–8114, 8714, 925 and 8115 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.PRO2086 (Accession NM\_014111) is another VGAM510 host target gene. PRO2086 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2086 BINDING SITE, designated SEQ ID:15344, to the nucleotide sequence of VGAM510 RNA, herein designated VGAM RNA, also designated SEQ ID:3221.

[22996] Another function of VGAM510 is therefore inhibition of PRO2086 (Accession NM\_014111). Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2086. Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282) is another VGAM510 host target gene. UHRF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UHRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF1 BINDING SITE, designated SEQ ID:14953, to the nucleotide sequence of

VGAM510 RNA, herein designated VGAM RNA, also designated SEQ ID:3221.

[22997] Another function of VGAM510 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282). Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF1. LOC139331 (Accession XM\_066631) is another VGAM510 host target gene. LOC139331 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139331 BINDING SITE, designated SEQ ID:37340, to the nucleotide sequence of VGAM510 RNA, herein designated VGAM RNA, also designated SEQ ID:3221.

[22998] Another function of VGAM510 is therefore inhibition of LOC139331 (Accession XM\_066631). Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139331. LOC151248 (Accession XM\_087143) is another VGAM510 host target gene. LOC151248 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39081, to the nucleotide sequence of VGAM510 RNA, herein designated VGAM RNA, also designated SEQ ID:3221.

[22999] Another function of VGAM510 is therefore inhibition of LOC151248 (Accession XM\_087143). Accordingly, utilities of VGAM510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151248. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 511 (VGAM511) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23000] VGAM511 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM511 was detected is described hereinabove with reference to Figs. 1-8.

[23001] VGAM511 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Green Mottle Mosaic Virus. VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23002] VGAM511 gene encodes a VGAM511 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM511 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM511 precursor RNA is designated SEQ ID:497, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:497 is located at position 1481 relative to the genome of Cucumber Green Mottle Mosaic Virus.

[23003] VGAM511 precursor RNA folds onto itself, forming VGAM511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[23004] An enzyme complex designated DICER COMPLEX, `dices` the VGAM511 folded precursor RNA into VGAM511 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM511 RNA is designated SEQ ID:3222, and is provided hereinbelow with reference to the sequence listing part.

[23005] VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM511 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23006] VGAM511 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM511 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM511 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM511 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23007] The complementary binding of VGAM511 RNA, herein designated VGAM RNA, to host target binding sites on VGAM511 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM511 host target RNA into VGAM511 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23008] It is appreciated that VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM511 host target genes. The mRNA of each one of this plurality of VGAM511 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM511 RNA, herein designated VGAM RNA, and which when bound by VGAM511 RNA causes inhibition of translation of respective one or more VGAM511 host target proteins.

[23009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM511 gene, herein designated VGAM GENE, on one or more VGAM511 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23010] It is yet further appreciated that a function of VGAM511 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of viral infection by Cucumber Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM511 correlate with, and may be deduced from, the identity of the host target genes which VGAM511 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23011] Nucleotide sequences of the VGAM511 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM511 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM511 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM511 are further described hereinbelow with reference to Table 1.

[23012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM511 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM511 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23013] As mentioned hereinabove with reference to Fig. 1, a function of VGAM511 gene, herein designated VGAM is inhibition of expression of VGAM511 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM511 correlate with, and may be deduced from, the identity of the target genes which VGAM511 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23014] Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932) is a VGAM511 host target gene. CDH6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11372, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23015] A function of VGAM511 is therefore inhibition of Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Interferon Regulatory Factor 2 (IRF2, Accession NM\_002199) is another VGAM511 host target gene. IRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRF2 BINDING SITE, designated SEQ ID:7957, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23016] Another function of VGAM511 is therefore inhibition of Interferon Regulatory Factor 2 (IRF2, Accession NM\_002199), a gene which is a transcriptional activator of type I interferon and interferon-inducible genes. Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF2. The function of IRF2 has been established by previous studies. Interferon regulatory factor-1 (IRF1; 147575), a transcriptional activator, and IRF2, its antagonistic repressor, are regulators of type I interferon and interferon-inducible genes. The IRF1 gene is itself interferon-inducible and hence may be one of the target genes critical for interferon action. Harada et al. (1993) found that when the IRF2 gene was overexpressed in NIH 3T3 cells, the cells became transformed and displayed enhanced tumorigenicity in nude mice. This transformed phenotype was reversed by concomitant expression of the IRF1 gene. Thus, restrained cell growth depends on a balance between these 2 mutually antagonistic transcription factors Nishio et al. (2001) screened for mutations in the 5-prime flanking and coding regions of IRF2 in patients with atopic dermatitis (see OMIM Ref. No. 603165). They found 5 novel variants and conducted a transmission dis-

equilibrium test in families identified through patients with atopic dermatitis. The data suggested that the IRF2 gene may play a role in the development of atopic dermatitis in Japanese Ko et al. (2002) noted that *Irf1*  $-/-$  mice are deficient in *Inos* (OMIM Ref. No. 163730), *Il12b* (OMIM Ref. No. 161561), Cd8-positive T cells, and natural killer (NK) cells, whereas *Irf2*  $-/-$  mice are deficient in NK cells and have dysregulated *Il12b* induction. *Icsbp* (OMIM Ref. No. 601565)  $-/-$  mice are deficient in *Il12b*, *Irf2*, and reactive oxygen intermediates (ROIs). All 3 are inducible by gamma-interferon (*Ifng*; 147570) and have varying susceptibility to different intracellular bacterial and protozoan pathogens. Ko et al. (2002) determined that *Irf1*  $-/-$  mice are highly susceptible to fatal liver damage from *Brucella abortus*, the causative agent of brucellosis, which manifests as arthritis, endocarditis, and meningitis in humans. In contrast, *Irf2*  $-/-$  mice are highly resistant to *Brucella*, whereas *Icsbp*  $-/-$  mice maintain a plateau of infection similar to that seen in *Il12b*  $-/-$  mice. The authors concluded that IL12, reactive nitrogen intermediates, and ROIs are probably crucial immune components in resistance to *Brucella* infection. Animal model experiments lend further support to the function of IRF2. Hida et al. (2000)

observed that *Irf2*  $-/-$  mice exhibited progressive cutaneous inflammation accompanied by hair loss and ulcer formation. Histopathologic analysis demonstrated epidermal thickening with proliferating keratinocytes expressing *Icam1*/Cd54 (OMIM Ref. No. 147840), features similar to those found in psoriasis. In addition, however, there was a disorganized muscle layer and prominent fibrosis. In the basal dermis, infiltrating Cd8 (see OMIM Ref. No. 186910)-positive rather than Cd4 (OMIM Ref. No. 186940)-positive T cells were involved in the development of disease. In vitro analysis showed that the Cd8 T cells exhibited prolonged activation and proliferation with high expression of Cd44 (OMIM Ref. No. 107269) and Ly6c. RT-PCR and Northern blot analysis detected spontaneous expression of *Ifna* (OMIM Ref. No. 147660) and *Ifnb* (OMIM Ref. No. 147640), as well as overexpression of IFN-inducible genes, i.e., *Oas* (see OMIM Ref. No. 603351), *Irf7* (OMIM Ref. No. 605047), *Ip10* (SCYB10; 147310), and *Mig* (SCYB9; 601704), in the *Irf2*  $-/-$  mice. Inactivation of the *Ifna*/*Ifnb* pathways by mutating *Ifnar1* (OMIM Ref. No. 107450) or *Irf9* resulted in the absence of skin disease in *Irf2*  $-/-$  mice.

[23017] It is appreciated that the abovementioned animal model

for IRF2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[23018] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23019] Ko, J.; Gendron-Fitzpatrick, A.; Splitter, G. A. : Susceptibility of IFN regulatory factor-1 and IFN consensus sequence binding protein-deficient mice to brucellosis. J. Immun. 168: 2433-2440, 2002. ; and

[23020] Nishio, Y.; Noguchi, E.; Ito, S.; Ichikawa, E.; Umebayashi, Y.; Otsuka, F.; Arinami, T. : Mutation and association analysis of the interferon regulatory factor 2 gene (IRF2) with atopic.

[23021] Further studies establishing the function and utilities of IRF2 are found in John Hopkins OMIM database record ID 147576, and in cited publications numbered 3397-3399, 339 and 3400 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sal-like 1 (Drosophila) (SALL1, Accession NM\_002968) is another VGAM511 host target gene. SALL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL1, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL1 BINDING SITE, designated SEQ ID:8879, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23022] Another function of VGAM511 is therefore inhibition of Sal-like 1 (Drosophila) (SALL1, Accession NM\_002968). Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL1. DKFZP547L112 (Accession XM\_039353) is another VGAM511 host target gene. DKFZP547L112 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP547L112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547L112 BINDING SITE, designated SEQ ID:33056, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23023] Another function of VGAM511 is therefore inhibition of DKFZP547L112 (Accession XM\_039353). Accordingly, util-

ities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547L112. Tripartite Motif-containing 2 (TRIM2, Accession NM\_015271) is another VGAM511 host target gene. TRIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17596, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23024] Another function of VGAM511 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM\_015271). Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. LOC161403 (Accession XM\_090873) is another VGAM511 host target gene. LOC161403 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161403, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161403 BINDING SITE, designated SEQ ID:40019, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23025] Another function of VGAM511 is therefore inhibition of LOC161403 (Accession XM\_090873). Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161403. LOC199926 (Accession XM\_117157) is another VGAM511 host target gene. LOC199926 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199926 BINDING SITE, designated SEQ ID:43261, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23026] Another function of VGAM511 is therefore inhibition of LOC199926 (Accession XM\_117157). Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199926. LOC202316 (Accession XM\_117380) is another VGAM511 host target gene. LOC202316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202316 BINDING SITE, designated SEQ ID:43426, to the nucleotide sequence of VGAM511 RNA, herein designated VGAM RNA, also designated SEQ ID:3222.

[23027] Another function of VGAM511 is therefore inhibition of LOC202316 (Accession XM\_117380). Accordingly, utilities of VGAM511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202316. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 512 (VGAM512) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23028] VGAM512 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM512 was detected is described hereinabove with reference to Figs. 1–8.

[23029] VGAM512 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Green Mottle Mosaic Virus. VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23030] VGAM512 gene encodes a VGAM512 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM512 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM512 precursor RNA is designated SEQ ID:498, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:498 is located at position 2385 relative to the genome of Cucumber Green Mottle Mosaic Virus.

[23031] VGAM512 precursor RNA folds onto itself, forming VGAM512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23032] An enzyme complex designated DICER COMPLEX, `dices` the VGAM512 folded precursor RNA into VGAM512 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM512 RNA is designated SEQ ID:3223, and is provided hereinbelow with reference to the sequence listing part.

[23033] VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM512 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23034] VGAM512 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM512 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM512 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23035] The complementary binding of VGAM512 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM512 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM512 host target RNA into VGAM512 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23036] It is appreciated that VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM512 host target genes. The mRNA of each one of this plurality of VGAM512 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM512 RNA, herein designated VGAM RNA, and which when bound by VGAM512 RNA causes inhibition of translation of respective one or more VGAM512 host target proteins.

[23037] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM512 gene, herein designated VGAM GENE, on one or more VGAM512 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23038] It is yet further appreciated that a function of VGAM512 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM512 include diagnosis, prevention and treatment of viral infection by Cucumber Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM512 correlate with, and may be deduced from, the identity of the host target genes which VGAM512 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23039] Nucleotide sequences of the VGAM512 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM512 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM512 are further described hereinbelow with reference to Table 1.

[23040] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM512 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM512 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23041] As mentioned hereinabove with reference to Fig. 1, a function of VGAM512 gene, herein designated VGAM is inhibition of expression of VGAM512 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM512 correlate with, and may be deduced from, the identity of the target genes which VGAM512 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23042] RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM\_046674) is a VGAM512 host target gene. RAB1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB1A, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB1A BINDING SITE, designated SEQ ID:34787, to the nucleotide sequence of VGAM512 RNA, herein designated VGAM RNA, also designated SEQ ID:3223.

[23043] A function of VGAM512 is therefore inhibition of RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM\_046674), a gene which is involved in vesicle transport. Accordingly, utilities of VGAM512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB1A. The function of RAB1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 513 (VGAM513) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23044] VGAM513 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM513 was detected is described hereinabove with reference to Figs. 1–8.

[23045] VGAM513 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Green Mottle Mosaic Virus. VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23046] VGAM513 gene encodes a VGAM513 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM513 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM513 precursor RNA is designated SEQ ID:499, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:499 is located at position 2231 relative to the genome of Cucumber Green Mottle Mosaic Virus.

[23047] VGAM513 precursor RNA folds onto itself, forming VGAM513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23048] An enzyme complex designated DICER COMPLEX, `dices` the VGAM513 folded precursor RNA into VGAM513 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM513 RNA is designated SEQ ID:3224, and is provided hereinbelow with reference to the sequence listing part.

[23049] VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM513 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23050] VGAM513 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM513 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM513 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23051] The complementary binding of VGAM513 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM513 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM513 host target RNA into VGAM513 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23052] It is appreciated that VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM513 host target genes. The mRNA of each one of this plurality of VGAM513 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM513 RNA, herein designated VGAM RNA, and which when bound by VGAM513 RNA causes inhibition of translation of respective one or more VGAM513 host target proteins.

[23053] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM513 gene, herein designated VGAM GENE, on one or more VGAM513 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23054] It is yet further appreciated that a function of VGAM513 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM513 include diagnosis, prevention and treatment of viral infection by Cucumber Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM513 correlate with, and may be deduced from, the identity of the host target genes which VGAM513 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23055] Nucleotide sequences of the VGAM513 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM513 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM513 are further described hereinbelow with reference to Table 1.

[23056] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM513 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM513 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23057] As mentioned hereinabove with reference to Fig. 1, a function of VGAM513 gene, herein designated VGAM is inhibition of expression of VGAM513 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM513 correlate with, and may be deduced from, the identity of the target genes which VGAM513 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23058] LAG1 Longevity Assurance Homolog 2 (*S. cerevisiae*) (LASS2, Accession XM\_041889) is a VGAM513 host target gene. LASS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

LASS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASS2 BINDING SITE, designated SEQ ID:33623, to the nucleotide sequence of VGAM513 RNA, herein designated VGAM RNA, also designated SEQ ID:3224.

[23059] A function of VGAM513 is therefore inhibition of LAG1 Longevity Assurance Homolog 2 (*S. cerevisiae*) (LASS2, Accession XM\_041889). Accordingly, utilities of VGAM513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASS2. FLJ14249 (Accession NM\_022460) is another VGAM513 host target gene. FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ14249, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14249 BINDING SITE1 and FLJ14249 BINDING SITE2, designated SEQ ID:22798 and SEQ ID:28168 respectively, to the nucleotide sequence of VGAM513 RNA, herein designated VGAM RNA, also designated SEQ ID:3224.

[23060] Another function of VGAM513 is therefore inhibition of FLJ14249 (Accession NM\_022460). Accordingly, utilities of VGAM513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14249. LOC149103 (Accession XM\_086434) is another VGAM513 host target gene. LOC149103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149103 BINDING SITE, designated SEQ ID:38652, to the nucleotide sequence of VGAM513 RNA, herein designated VGAM RNA, also designated SEQ ID:3224.

[23061] Another function of VGAM513 is therefore inhibition of LOC149103 (Accession XM\_086434). Accordingly, utilities of VGAM513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 514 (VGAM514) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[23062] VGAM514 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM514 was detected is described hereinabove with reference to Figs. 1–8.

[23063] VGAM514 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Green Mottle Mosaic Virus. VGAM514 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23064] VGAM514 gene encodes a VGAM514 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM514 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM514 precursor RNA is designated SEQ ID:500, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:500 is located at position 1818 relative to the genome of Cucumber Green Mottle Mosaic Virus.

[23065] VGAM514 precursor RNA folds onto itself, forming VGAM514 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[23066] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM514 folded precursor RNA into VGAM514 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 80%) nucleotide se-  
quence of VGAM514 RNA is designated SEQ ID:3225, and  
is provided hereinbelow with reference to the sequence  
listing part.

[23067] VGAM514 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM514 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM514 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23068] VGAM514 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM514 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM514 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23069] The complementary binding of VGAM514 RNA, herein designated VGAM RNA, to host target binding sites on VGAM514 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM514 host target RNA into VGAM514 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23070] It is appreciated that VGAM514 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM514 host target genes. The mRNA of each one of this plurality of VGAM514 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM514 RNA, herein designated VGAM RNA, and which when bound by VGAM514 RNA causes inhibition of translation of respective one or more VGAM514 host target proteins.

[23071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM514 gene, herein designated VGAM GENE, on one or more VGAM514 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23072] It is yet further appreciated that a function of VGAM514 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of viral infection by Cucumber Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM514 correlate with, and may be deduced from, the identity of the host target genes which VGAM514 binds and inhibits, and the function of these host target

genes, as elaborated hereinbelow.

[23073] Nucleotide sequences of the VGAM514 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM514 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM514 are further described hereinbelow with reference to Table 1.

[23074] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM514 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM514 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23075] As mentioned hereinabove with reference to Fig. 1, a function of VGAM514 gene, herein designated VGAM is inhibition of expression of VGAM514 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM514 correlate with, and may be deduced from, the identity of the target genes which VGAM514 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23076] Galanin (GAL, Accession XM\_166189) is a VGAM514 host target gene. GAL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAL BINDING SITE, designated SEQ ID:43998, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23077] A function of VGAM514 is therefore inhibition of Galanin (GAL, Accession XM\_166189), a gene which stimulates LH secretion and enhances LHRH-induced LH release from dispersed anterior pituitary cells in vitro. Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAL. The function of GAL has been established by previous studies. Galanin is a 29-amino acid peptide widely distributed in the peripheral and central nervous systems. In the brain, the highest concentrations are observed in the hypothalamus and particularly in the nerve terminals of the median eminence. Since the establishment of the neurovascular concept in the regulation of the

hypothalamus–pituitary axis (Harris, 1948), it is well known that the median eminence represents a key area for neuroendocrine regulation. Hypothalamic releasing and inhibiting factors are secreted from median eminence terminals into the portal circulation to reach the adenohypophyseal cells where they exert specific actions. Lopez et al. (1991) presented evidence that galanin meets the criteria to be considered a hypothalamic–hypophysiotropic hormone. They found a possibly meaningful colocalization and cosecretion of galanin and LHRH (OMIM Ref. No. 152760). Galanin stimulates LH secretion and enhances LHRH–induced LH release from dispersed anterior pituitary cells in vitro. Galanin is important to gastrointestinal function also (Rattan, 1991). Animal model experiments lend further support to the function of GAL. The neuropeptide galanin is predominantly expressed by the lactotrophs (the prolactin–secreting cell type) in the rodent anterior pituitary and in the median eminence and paraventricular nucleus of the hypothalamus. Prolactin (PRL; 176760) and galanin colocalize in the same secretory granule, and the expression of both proteins is extremely sensitive to the estrogen status of the animal. Administration of estradiol–17–beta induces pituitary hyperplasia

followed by adenoma formation and causes a 3,000-fold increase in the galanin mRNA content of the lactotroph. To further study the role of galanin in prolactin release and lactotroph growth, Wynick et al. (1998) generated mice carrying a loss-of-function mutation of the endogenous galanin gene. There was no evidence of embryonic lethality and the mutant mice grew normally. The specific endocrine abnormalities identified related to the expression of prolactin. Pituitary prolactin message levels and protein content of adult female mutant mice were reduced by 30 to 40% compared with wildtype controls. Mutant females failed to lactate and pups died of starvation/dehydration unless fostered onto wildtype mothers. Prolactin secretion in mutant females was markedly reduced at 7 days postpartum compared with wildtype controls with an associated failure in mammary gland maturation. There was almost complete abrogation of the proliferative response of the lactotroph to high doses of estrogen, with a failure to upregulate prolactin release and STAT5 (OMIM Ref. No. 601511) expression or to increase pituitary cell number. These data supported the hypothesis that galanin acts as a paracrine regulator of prolactin expression and as a growth factor to the lactotroph.

- [23078] It is appreciated that the abovementioned animal model for GAL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.
- [23079] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [23080] Wynick, D.; Small, C. J.; Bacon, A.; Holmes, F. E.; Norman, M.; Ormandy, C. J.; Kilic, E.; Kerr, N. C. H.; Ghatei, M.; Talamantes, F.; Bloom, S. R.; Pachnis, V. : Galanin regulates prolactin release and lactotroph proliferation. *Proc. Nat. Acad. Sci.* 95: 12671–12676, 1998. ; and
- [23081] Lopez, F. J.; Merchenthaler, I.; Ching, M.; Wisniewski, M. G.; Negro-Vilar, A. : Galanin: a hypothalamic-hypophysiotropic hormone modulating reproductive functions. *Proc. Nat. Acad. Sci.*
- [23082] Further studies establishing the function and utilities of GAL are found in John Hopkins OMIM database record ID 137035, and in sited publications numbered 4054–4065 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM\_016611) is another VGAM514 host target gene. KCN4 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK4 BINDING SITE, designated SEQ ID:18714, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23083] Another function of VGAM514 is therefore inhibition of Potassium Channel, Subfamily K, Member 4 (KCNK4, Accession NM\_016611). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK4. LIM Domain Kinase 1 (LIMK1, Accession NM\_016735) is another VGAM514 host target gene. LIMK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LIMK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE, designated SEQ ID:18798, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23084] Another function of VGAM514 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM\_016735). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Matrix Metalloproteinase 25 (MMP25, Accession NM\_022468) is another VGAM514 host target gene. MMP25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP25 BINDING SITE, designated SEQ ID:22821, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23085] Another function of VGAM514 is therefore inhibition of Matrix Metalloproteinase 25 (MMP25, Accession NM\_022468). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP25. MLL Septin-like Fusion (MSF, Accession XM\_113892) is another VGAM514 host target gene. MSF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by MSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSF BINDING SITE, designated SEQ ID:42521, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23086] Another function of VGAM514 is therefore inhibition of MLL Septin-like Fusion (MSF, Accession XM\_113892), a gene which plays a role in the cell cycle. Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSF. The function of MSF has been established by previous studies. Bahabri et al. (1998) mapped the locus for autosomal recessive camptodactyly–arthropathy–coxa vara–pericarditis syndrome (CACP; 208250) to chromosome 1q25–q31. Marcelino et al. (1999) independently identified the CACP gene using a positional cloning approach. They determined that the MSF and CACP genes are the same. Analysis of a human multitissue Northern blot demonstrated that the 4.5–kb CACP mRNA is expressed in tissues including liver, lung, and heart. It is highly expressed in synovial tissue. The 30–kD N-terminal

megakaryocyte–stimulating factor fragment was detectable in serum and urine. Marcelino et al. (1999) identified 8 likely disease–causing mutations in patients with CACP from consanguineous families. Four were homozygous deletions. Additionally, they detected a dinucleotide transversion that created a nonsense codon, and a 41–bp insertion 14 nucleotides upstream of the intron 6 splice acceptor site that disrupted the polypyrimidine tract of the splice site. Each of these mutations was predicted to result in a truncated protein. Due to its high glycosylation content and mucin–like repeats, Marcelino et al. (1999) suggested that CACP may act as a joint/intimal cell lubricant. Both synovial and pericardial cell hyperplasia may represent secondary consequences of insufficient cell surface lubrication. Alternatively, cell overgrowth may be primary to the pathogenesis of CACP. The occurrence of multiple small ganglion cysts in 2 unrelated patients, and of coxa vara deformity in this disorder, suggested a regulatory role for the CACP protein product to Marcelino et al. (1999).

[23087] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [23088] Bahabri, S. A.; Suwairi, W. M.; Laxer, R. M.; Polinkovsky, A.; Dalaan, A. A.; Warman, M. L. : The camptodactyly–arthropathy–coxa vara–pericarditis syndrome: clinical features and genetic mapping to human chromosome 1. *Arthritis Rheum.* 41: 730–735, 1998. ; and
- [23089] Marcelino, J.; Carpten, J. D.; Suwairi, W. M.; Gutierrez, O. M.; Schwartz, S.; Robbins, C.; Sood, R.; Makalowska, I.; Baxevanis, A.; Johnstone, B.; Laxer, R. M.; Zemel, L.; and 13 other.
- [23090] Further studies establishing the function and utilities of MSF are found in John Hopkins OMIM database record ID 604283, and in cited publications numbered 2073, 7617–7618, 207 and 7619–7620 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PTK7 Protein Tyrosine Kinase 7 (PTK7, Accession NM\_002821) is another VGAM514 host target gene. PTK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK7 BINDING SITE, designated SEQ ID:8688, to the nucleotide sequence of VGAM514 RNA, herein des–

ignated VGAM RNA, also designated SEQ ID:3225.

[23091] Another function of VGAM514 is therefore inhibition of PTK7 Protein Tyrosine Kinase 7 (PTK7, Accession NM\_002821), a gene which is a glycosylated receptor protein tyrosine kinase and may function as a cell adhesion molecule. Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK7. The function of PTK7 has been established by previous studies. Protein-tyrosine kinases (PTKs) play important roles in regulating cell proliferation and differentiation during development. Lee et al. (1993) isolated a 220-bp fragment of PTK7 cDNA through a screen designed to identify tyrosine kinase mRNAs expressed in normal human melanocytes. This fragment was mapped to chromosome 6 by Southern blotting using a panel of human-hamster somatic cell hybrids. Park et al. (1996) isolated a full-length PTK7 cDNA and found that it encodes a receptor protein-tyrosine kinase-like molecule closely related to a chick kinase-like gene whose function was unknown. Mossie et al. (1995) independently isolated the PTK7 gene from colon carcinoma and designated it colon carcinoma kinase-4. Banga et al. (1997) sublocalized the PTK7 gene to 6p21.1-p12.2 by fluorescence in

situ hybridization.

[23092] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23093] Lee, S.-T.; Strunk, K. M.; Spritz, R. A. : A survey of protein tyrosine kinase mRNAs expressed in normal human melanocytes. *Oncogene* 8: 3403–3410, 1993. ; and

[23094] Park, S.-K.; Lee, H.-S.; Lee, S.-T. : Characterization of the human full-length PTK7 cDNA encoding a receptor protein tyrosine kinase-like molecule closely related to chick KLG. *J. Bioch.*

[23095] Further studies establishing the function and utilities of PTK7 are found in John Hopkins OMIM database record ID 601890, and in cited publications numbered 6703–6706 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ring Finger Protein 4 (RNF4, Accession NM\_002938) is another VGAM514 host target gene. RNF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF4 BINDING SITE, designated

SEQ ID:8840, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23096] Another function of VGAM514 is therefore inhibition of Ring Finger Protein 4 (RNF4, Accession NM\_002938). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF4. Solute Carrier Family 8 (sodium-calcium exchanger), Member 2 (SLC8A2, Accession XM\_038970) is another VGAM514 host target gene. SLC8A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC8A2 BINDING SITE, designated SEQ ID:32967, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23097] Another function of VGAM514 is therefore inhibition of Solute Carrier Family 8 (sodium-calcium exchanger), Member 2 (SLC8A2, Accession XM\_038970). Accordingly, utilities of VGAM514 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SLC8A2. DKFZP727G051 (Accession XM\_045308) is another VGAM514 host target gene. DKFZP727G051 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP727G051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727G051 BINDING SITE, designated SEQ ID:34429, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23098] Another function of VGAM514 is therefore inhibition of DKFZP727G051 (Accession XM\_045308). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727G051. FLJ00007 (Accession XM\_048928) is another VGAM514 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ00007 BINDING SITE, designated SEQ ID:35308, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23099] Another function of VGAM514 is therefore inhibition of FLJ00007 (Accession XM\_048928). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. KIAA0237 (Accession NM\_014747) is another VGAM514 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16444, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23100] Another function of VGAM514 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA1656 (Accession XM\_038022) is another VGAM514 host target gene. KIAA1656 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32728, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23101] Another function of VGAM514 is therefore inhibition of KIAA1656 (Accession XM\_038022). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. LOC112840 (Accession NM\_080666) is another VGAM514 host target gene. LOC112840 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112840 BINDING SITE, designated SEQ ID:27956, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23102] Another function of VGAM514 is therefore inhibition of

LOC112840 (Accession NM\_080666). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112840. LOC115207 (Accession NM\_138444) is another VGAM514 host target gene. LOC115207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115207 BINDING SITE, designated SEQ ID:28807, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23103] Another function of VGAM514 is therefore inhibition of LOC115207 (Accession NM\_138444). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115207. LOC147136 (Accession XM\_085716) is another VGAM514 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38300, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23104] Another function of VGAM514 is therefore inhibition of LOC147136 (Accession XM\_085716). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC222031 (Accession XM\_168371) is another VGAM514 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45131, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23105] Another function of VGAM514 is therefore inhibition of LOC222031 (Accession XM\_168371). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC254556 (Accession XM\_170588) is an-

other VGAM514 host target gene. LOC254556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254556 BINDING SITE, designated SEQ ID:45393, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23106] Another function of VGAM514 is therefore inhibition of LOC254556 (Accession XM\_170588). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254556. LOC257428 (Accession XM\_168584) is another VGAM514 host target gene. LOC257428 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257428 BINDING SITE, designated SEQ ID:45261, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23107] Another function of VGAM514 is therefore inhibition of LOC257428 (Accession XM\_168584). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257428. LOC56965 (Accession NM\_020213) is another VGAM514 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:21451, to the nucleotide sequence of VGAM514 RNA, herein designated VGAM RNA, also designated SEQ ID:3225.

[23108] Another function of VGAM514 is therefore inhibition of LOC56965 (Accession NM\_020213). Accordingly, utilities of VGAM514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56965. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 515 (VGAM515) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[23109] VGAM515 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM515 was detected is described hereinabove with reference to Figs. 1–8.

[23110] VGAM515 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cucumber Green Mottle Mosaic Virus. VGAM515 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23111] VGAM515 gene encodes a VGAM515 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM515 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM515 precursor RNA is designated SEQ ID:501, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:501 is located at position 4400 relative to the genome of Cucumber Green Mottle Mosaic Virus.

[23112] VGAM515 precursor RNA folds onto itself, forming VGAM515 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[23113] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM515 folded precursor RNA into VGAM515 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM515 RNA is designated SEQ ID:3226, and  
is provided hereinbelow with reference to the sequence  
listing part.

[23114] VGAM515 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM515 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM515 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23115] VGAM515 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM515 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM515 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23116] The complementary binding of VGAM515 RNA, herein designated VGAM RNA, to host target binding sites on VGAM515 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM515 host target RNA into VGAM515 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23117] It is appreciated that VGAM515 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM515 host target genes. The mRNA of each one of this plurality of VGAM515 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM515 RNA, herein designated VGAM RNA, and which when bound by VGAM515 RNA causes inhibition of translation of respective one or more VGAM515 host target proteins.

[23118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM515 gene, herein designated VGAM GENE, on one or more VGAM515 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23119] It is yet further appreciated that a function of VGAM515 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of viral infection by Cucumber Green Mottle Mosaic Virus. Specific functions, and accordingly utilities, of VGAM515 correlate with, and may be deduced from, the identity of the host target genes which VGAM515 binds and inhibits, and the function of these host target

genes, as elaborated hereinbelow.

- [23120] Nucleotide sequences of the VGAM515 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM515 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM515 are further described hereinbelow with reference to Table 1.
- [23121] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM515 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM515 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [23122] As mentioned hereinabove with reference to Fig. 1, a function of VGAM515 gene, herein designated VGAM is inhibition of expression of VGAM515 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM515 correlate with, and may be deduced from, the identity of the target genes which VGAM515 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23123] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898) is a VGAM515 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23162, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23124] A function of VGAM515 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Homeo Box A7 (HOXA7, Accession NM\_006896) is another VGAM515 host target gene. HOXA7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXA7 BINDING SITE, designated

SEQ ID:13771, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23125] Another function of VGAM515 is therefore inhibition of Homeo Box A7 (HOXA7, Accession NM\_006896), a gene which provides cells with specific positional identities on the anterior-posterior axis. Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA7. The function of HOXA7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.DKFZP566G1424 (Accession XM\_097771) is another VGAM515 host target gene. DKFZP566G1424 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566G1424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566G1424 BINDING SITE, designated SEQ ID:41114, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23126] Another function of VGAM515 is therefore inhibition of DKFZP566G1424 (Accession XM\_097771). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566G1424. FLJ11125 (Accession XM\_005318) is another VGAM515 host target gene. FLJ11125 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11125 BINDING SITE, designated SEQ ID:29977, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23127] Another function of VGAM515 is therefore inhibition of FLJ11125 (Accession XM\_005318). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11125. KIAA1465 (Accession XM\_027396) is another VGAM515 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:30506, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23128] Another function of VGAM515 is therefore inhibition of KIAA1465 (Accession XM\_027396). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465. KIAA1771 (Accession XM\_086404) is another VGAM515 host target gene. KIAA1771 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1771 BINDING SITE, designated SEQ ID:38635, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23129] Another function of VGAM515 is therefore inhibition of KIAA1771 (Accession XM\_086404). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1771. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM\_138714) is another VGAM515 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:28959, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23130] Another function of VGAM515 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM\_138714). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. Protocadherin 17 (PCDH17, Accession NM\_014459) is another VGAM515 host target gene. PCDH17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH17

BINDING SITE, designated SEQ ID:15814, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23131] Another function of VGAM515 is therefore inhibition of Protocadherin 17 (PCDH17, Accession NM\_014459). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH17. SSB-3 (Accession NM\_080861) is another VGAM515 host target gene. SSB-3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SSB-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-3 BINDING SITE, designated SEQ ID:28101, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23132] Another function of VGAM515 is therefore inhibition of SSB-3 (Accession NM\_080861). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-3. LOC152300 (Accession XM\_087432) is another VGAM515 host target gene. LOC152300 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39250, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23133] Another function of VGAM515 is therefore inhibition of LOC152300 (Accession XM\_087432). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC207089 (Accession XM\_115923) is another VGAM515 host target gene. LOC207089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC207089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC207089 BINDING SITE, designated SEQ ID:43108, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23134] Another function of VGAM515 is therefore inhibition of

LOC207089 (Accession XM\_115923). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC207089. LOC221399 (Accession XM\_168134) is another VGAM515 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45049, to the nucleotide sequence of VGAM515 RNA, herein designated VGAM RNA, also designated SEQ ID:3226.

[23135] Another function of VGAM515 is therefore inhibition of LOC221399 (Accession XM\_168134). Accordingly, utilities of VGAM515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 516 (VGAM516) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[23136] VGAM516 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM516 was detected is described hereinabove with reference to Figs. 1–8.

[23137] VGAM516 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Galinsoga Mosaic Virus. VGAM516 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23138] VGAM516 gene encodes a VGAM516 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM516 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM516 precursor RNA is designated SEQ ID:502, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:502 is located at position 2863 relative to the genome of Galinsoga Mosaic Virus.

[23139] VGAM516 precursor RNA folds onto itself, forming VGAM516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[23140] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM516 folded precursor RNA into VGAM516 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 79%) nucleotide se-  
quence of VGAM516 RNA is designated SEQ ID:3227, and  
is provided hereinbelow with reference to the sequence  
listing part.

[23141] VGAM516 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM516 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM516 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[23142] VGAM516 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM516 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM516 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[23143] The complementary binding of VGAM516 RNA, herein designated VGAM RNA, to host target binding sites on VGAM516 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM516 host target RNA into VGAM516 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23144] It is appreciated that VGAM516 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM516 host target genes. The mRNA of each one of this plurality of VGAM516 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM516 RNA, herein designated VGAM RNA, and which when bound by VGAM516 RNA causes inhibition of translation of respective one or more VGAM516 host target proteins.

[23145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM516 gene, herein designated VGAM GENE, on one or

more VGAM516 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23146] It is yet further appreciated that a function of VGAM516 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of viral infection by Galinsoga Mosaic Virus. Specific functions, and accordingly utilities, of VGAM516 correlate with, and may be deduced from, the identity of the host target genes which VGAM516 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [23147] Nucleotide sequences of the VGAM516 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM516 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM516 are further described hereinbelow with reference to Table 1.
- [23148] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM516 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM516 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [23149] As mentioned hereinabove with reference to Fig. 1, a function of VGAM516 gene, herein designated VGAM is inhibition of expression of VGAM516 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM516 correlate with, and may be deduced from, the identity of the target genes which VGAM516 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [23150] Bromodomain Adjacent to Zinc Finger Domain, 1B (BAZ1B,

Accession NM\_032408) is a VGAM516 host target gene. BAZ1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAZ1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAZ1B BINDING SITE, designated SEQ ID:26192, to the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, also designated SEQ ID:3227.

[23151] A function of VGAM516 is therefore inhibition of Bromodomain Adjacent to Zinc Finger Domain, 1B (BAZ1B, Accession NM\_032408). Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAZ1B. APCL (Accession NM\_005883) is another VGAM516 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12495, to the nucleotide sequence of VGAM516 RNA, herein designated

VGAM RNA, also designated SEQ ID:3227.

[23152] Another function of VGAM516 is therefore inhibition of APCL (Accession NM\_005883). Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. FLJ14547 (Accession NM\_032804) is another VGAM516 host target gene. FLJ14547 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14547 BINDING SITE, designated SEQ ID:26559, to the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, also designated SEQ ID:3227.

[23153] Another function of VGAM516 is therefore inhibition of FLJ14547 (Accession NM\_032804). Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14547. PRAX-1 (Accession NM\_004758) is another VGAM516 host target gene. PRAX-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRAX-1, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRAX-1 BINDING SITE, designated SEQ ID:11145, to the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, also designated SEQ ID:3227.

[23154] Another function of VGAM516 is therefore inhibition of PRAX-1 (Accession NM\_004758). Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRAX-1. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM516 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16086, to the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, also designated SEQ ID:3227.

[23155] Another function of VGAM516 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM516 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with SDC3. LOC150577 (Accession XM\_097918) is another VGAM516 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41224, to the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, also designated SEQ ID:3227.

[23156] Another function of VGAM516 is therefore inhibition of LOC150577 (Accession XM\_097918). Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC151162 (Accession XM\_098012) is another VGAM516 host target gene. LOC151162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151162 BINDING SITE, designated SEQ ID:41307, to the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, also designated SEQ ID:3227.

[23157] Another function of VGAM516 is therefore inhibition of LOC151162 (Accession XM\_098012). Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151162. LOC203377 (Accession XM\_117540) is another VGAM516 host target gene. LOC203377 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203377 BINDING SITE, designated SEQ ID:43542, to the nucleotide sequence of VGAM516 RNA, herein designated VGAM RNA, also designated SEQ ID:3227.

[23158] Another function of VGAM516 is therefore inhibition of LOC203377 (Accession XM\_117540). Accordingly, utilities of VGAM516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203377. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 517 (VGAM517) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23159] VGAM517 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM517 was detected is described hereinabove with reference to Figs. 1–8.

[23160] VGAM517 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Galinsoga Mosaic Virus. VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23161] VGAM517 gene encodes a VGAM517 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM517 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM517 precursor RNA is designated SEQ ID:503, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:503 is located at position 3248 relative to the genome of Galin–

soga Mosaic Virus.

[23162] VGAM517 precursor RNA folds onto itself, forming VGAM517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23163] An enzyme complex designated DICER COMPLEX, `dices` the VGAM517 folded precursor RNA into VGAM517 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM517 RNA is designated SEQ ID:3228, and is provided hereinbelow with reference to the sequence listing part.

[23164] VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM517 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23165] VGAM517 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM517 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM517 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23166] The complementary binding of VGAM517 RNA, herein designated VGAM RNA, to host target binding sites on VGAM517 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM517 host target RNA into VGAM517 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23167] It is appreciated that VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM517 host target genes. The mRNA of each one of this plurality of VGAM517 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM517 RNA, herein designated VGAM RNA, and which when bound by VGAM517 RNA causes inhibition of translation of respective one or more VGAM517 host target proteins.

[23168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM517 gene, herein designated VGAM GENE, on one or more VGAM517 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23169] It is yet further appreciated that a function of VGAM517 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of viral infection by Galinsoga Mosaic Virus. Specific functions, and accordingly utilities, of VGAM517

correlate with, and may be deduced from, the identity of the host target genes which VGAM517 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23170] Nucleotide sequences of the VGAM517 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM517 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM517 are further described hereinbelow with reference to Table 1.

[23171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM517 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM517 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23172] As mentioned hereinabove with reference to Fig. 1, a function of VGAM517 gene, herein designated VGAM is inhibition of expression of VGAM517 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM517 correlate with, and may be deduced

from, the identity of the target genes which VGAM517 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23173] Interleukin 18 Receptor 1 (IL18R1, Accession NM\_003855) is a VGAM517 host target gene. IL18R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL18R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL18R1 BINDING SITE, designated SEQ ID:9950, to the nucleotide sequence of VGAM517 RNA, herein designated VGAM RNA, also designated SEQ ID:3228.

[23174] A function of VGAM517 is therefore inhibition of Interleukin 18 Receptor 1 (IL18R1, Accession NM\_003855), a gene which is required for dorsal-ventral embryonic polarity and promotes heterophilic cellular adhesion. Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL18R1. The function of IL18R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37. Lunatic Fringe Ho-

molog (Drosophila) (LFNG, Accession XM\_166539) is another VGAM517 host target gene. LFNG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFNG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFNG BINDING SITE, designated SEQ ID:44511, to the nucleotide sequence of VGAM517 RNA, herein designated VGAM RNA, also designated SEQ ID:3228.

[23175] Another function of VGAM517 is therefore inhibition of Lunatic Fringe Homolog (Drosophila) (LFNG, Accession XM\_166539). Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFNG. HSPC014 (Accession NM\_015932) is another VGAM517 host target gene. HSPC014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC014 BINDING SITE, designated SEQ ID:18053, to the nucleotide sequence of VGAM517 RNA,

herein designated VGAM RNA, also designated SEQ ID:3228.

[23176] Another function of VGAM517 is therefore inhibition of HSPC014 (Accession NM\_015932). Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC014. KIAA0261 (Accession XM\_042946) is another VGAM517 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33834, to the nucleotide sequence of VGAM517 RNA, herein designated VGAM RNA, also designated SEQ ID:3228.

[23177] Another function of VGAM517 is therefore inhibition of KIAA0261 (Accession XM\_042946). Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0261. KIAA1727 (Accession XM\_034262) is another VGAM517 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32028, to the nucleotide sequence of VGAM517 RNA, herein designated VGAM RNA, also designated SEQ ID:3228.

[23178] Another function of VGAM517 is therefore inhibition of KIAA1727 (Accession XM\_034262). Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. LOC162333 (Accession XM\_102591) is another VGAM517 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42120, to the nucleotide sequence of VGAM517 RNA, herein designated VGAM RNA, also designated SEQ ID:3228.

[23179] Another function of VGAM517 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities

of VGAM517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC90906 (Accession XM\_034809) is another VGAM517 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32154, to the nucleotide sequence of VGAM517 RNA, herein designated VGAM RNA, also designated SEQ ID:3228.

[23180] Another function of VGAM517 is therefore inhibition of LOC90906 (Accession XM\_034809). Accordingly, utilities of VGAM517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 518 (VGAM518) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23181] VGAM518 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM518 was detected is described hereinabove with reference to Figs. 1–8.

[23182] VGAM518 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM518 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23183] VGAM518 gene encodes a VGAM518 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM518 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM518 precursor RNA is designated SEQ ID:504, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:504 is located at position 10108 relative to the genome of Lymphocystis Disease Virus 1.

[23184] VGAM518 precursor RNA folds onto itself, forming VGAM518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23185] An enzyme complex designated DICER COMPLEX, `dices` the VGAM518 folded precursor RNA into VGAM518 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM518 RNA is designated SEQ ID:3229, and is provided hereinbelow with reference to the sequence listing part.

[23186] VGAM518 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM518 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[23187] VGAM518 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM518 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM518 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23188] The complementary binding of VGAM518 RNA, herein designated VGAM RNA, to host target binding sites on VGAM518 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM518 host target RNA into VGAM518 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23189] It is appreciated that VGAM518 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM518 host target genes. The mRNA of each one of this plurality of VGAM518 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM518 RNA, herein designated VGAM RNA, and which when bound by VGAM518 RNA causes inhibition of translation of respective one or more VGAM518 host target proteins.

[23190] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM518 gene, herein designated VGAM GENE, on one or more VGAM518 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23191] It is yet further appreciated that a function of VGAM518 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of viral infection by Lymphocystis Disease Virus 1. Specific functions, and accordingly utilities, of VGAM518 correlate with, and may be deduced from, the identity of the host target genes which VGAM518 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23192] Nucleotide sequences of the VGAM518 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM518 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM518 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM518 are further  
described hereinbelow with reference to Table 1.

[23193] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM518 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM518 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[23194] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM518 gene, herein designated VGAM is  
inhibition of expression of VGAM518 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM518 correlate with, and may be deduced  
from, the identity of the target genes which VGAM518  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[23195] IL2-inducible T-cell Kinase (ITK, Accession NM\_005546) is  
a VGAM518 host target gene. ITK BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:12079, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23196] A function of VGAM518 is therefore inhibition of IL2-inducible T-cell Kinase (ITK, Accession NM\_005546), a gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITK. The function of ITK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM288. Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM\_038350) is another VGAM518 host target gene. PDGFRB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRB BINDING SITE, designated SEQ ID:32819, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23197] Another function of VGAM518 is therefore inhibition of Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM\_038350), a gene which Platelet-derived growth factor receptor beta chain; tyrosine kinase receptor. Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRB. The function of PDGFRB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736) is another VGAM518 host target gene. XPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPR1 BINDING SITE, designated SEQ

ID:11126, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23198] Another function of VGAM518 is therefore inhibition of Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736), a gene which is a putative G protein-coupled receptor and a target for xenotropic and polytropic murine leukemia retroviruses. Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPR1. The function of XPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM\_033576) is another VGAM518 host target gene. C5orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf7 BINDING SITE, designated SEQ ID:31941, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3229.

[23199] Another function of VGAM518 is therefore inhibition of Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM\_033576). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf7. DT1P1A10 (Accession XM\_029187) is another VGAM518 host target gene. DT1P1A10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DT1P1A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DT1P1A10 BINDING SITE, designated SEQ ID:30857, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23200] Another function of VGAM518 is therefore inhibition of DT1P1A10 (Accession XM\_029187). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DT1P1A10. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM\_019063) is another VGAM518 host target gene. EML4 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:21147, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23201] Another function of VGAM518 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM\_019063). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295) is another VGAM518 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34943, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ

ID:3229.

[23202] Another function of VGAM518 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. FLJ10583 (Accession NM\_018148) is another VGAM518 host target gene. FLJ10583 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10583 BINDING SITE, designated SEQ ID:19951, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23203] Another function of VGAM518 is therefore inhibition of FLJ10583 (Accession NM\_018148). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10583. FLJ20154 (Accession XM\_053688) is another VGAM518 host target gene. FLJ20154 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by FLJ20154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20154 BINDING SITE, designated SEQ ID:36107, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23204] Another function of VGAM518 is therefore inhibition of FLJ20154 (Accession XM\_053688). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20154. Heat Shock Transcription Factor 2 (HSF2, Accession NM\_004506) is another VGAM518 host target gene. HSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSF2 BINDING SITE, designated SEQ ID:10838, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23205] Another function of VGAM518 is therefore inhibition of Heat Shock Transcription Factor 2 (HSF2, Accession

NM\_004506). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSF2. KIAA1323 (Accession XM\_032146) is another VGAM518 host target gene.

KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31570, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23206] Another function of VGAM518 is therefore inhibition of KIAA1323 (Accession XM\_032146). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM\_033334) is another VGAM518 host target gene. NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR6A1, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3, designated SEQ ID:27182, SEQ ID:27188 and SEQ ID:7234 respectively, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23207] Another function of VGAM518 is therefore inhibition of Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM\_033334). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR6A1. LOC158235 (Accession XM\_098897) is another VGAM518 host target gene. LOC158235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158235 BINDING SITE, designated SEQ ID:41925, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23208] Another function of VGAM518 is therefore inhibition of

LOC158235 (Accession XM\_098897). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158235. LOC158434 (Accession XM\_098939) is another VGAM518 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41988, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23209] Another function of VGAM518 is therefore inhibition of LOC158434 (Accession XM\_098939). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC203350 (Accession XM\_117536) is another VGAM518 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43536, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23210] Another function of VGAM518 is therefore inhibition of LOC203350 (Accession XM\_117536). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC219529 (Accession XM\_167563) is another VGAM518 host target gene. LOC219529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219529 BINDING SITE, designated SEQ ID:44674, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23211] Another function of VGAM518 is therefore inhibition of LOC219529 (Accession XM\_167563). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219529. LOC253613 (Accession XM\_171225) is an-

other VGAM518 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46009, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23212] Another function of VGAM518 is therefore inhibition of LOC253613 (Accession XM\_171225). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. LOC255252 (Accession XM\_170779) is another VGAM518 host target gene. LOC255252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255252 BINDING SITE, designated SEQ ID:45549, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23213] Another function of VGAM518 is therefore inhibition of LOC255252 (Accession XM\_170779). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255252. LOC90750 (Accession XM\_033868) is another VGAM518 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31969, to the nucleotide sequence of VGAM518 RNA, herein designated VGAM RNA, also designated SEQ ID:3229.

[23214] Another function of VGAM518 is therefore inhibition of LOC90750 (Accession XM\_033868). Accordingly, utilities of VGAM518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 519 (VGAM519) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[23215] VGAM519 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM519 was detected is described hereinabove with reference to Figs. 1–8.

[23216] VGAM519 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM519 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23217] VGAM519 gene encodes a VGAM519 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM519 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM519 precursor RNA is designated SEQ ID:505, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:505 is located at position 70833 relative to the genome of Lymphocystis Disease Virus 1.

[23218] VGAM519 precursor RNA folds onto itself, forming VGAM519 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[23219] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM519 folded precursor RNA into VGAM519 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM519 RNA is designated SEQ ID:3230, and  
is provided hereinbelow with reference to the sequence  
listing part.

[23220] VGAM519 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM519 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM519 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23221] VGAM519 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM519 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM519 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23222] The complementary binding of VGAM519 RNA, herein designated VGAM RNA, to host target binding sites on VGAM519 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM519 host target RNA into VGAM519 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23223] It is appreciated that VGAM519 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM519 host target genes. The mRNA of each one of this plurality of VGAM519 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM519 RNA, herein designated VGAM RNA, and which when bound by VGAM519 RNA causes inhibition of translation of respective one or more VGAM519 host target proteins.

[23224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM519 gene, herein designated VGAM GENE, on one or more VGAM519 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23225] It is yet further appreciated that a function of VGAM519 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM519 include diagnosis, prevention and treatment of viral infection by Lymphocystis Disease Virus 1. Specific functions, and accordingly utilities, of VGAM519 correlate with, and may be deduced from, the identity of the host target genes which VGAM519 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[23226] Nucleotide sequences of the VGAM519 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM519 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM519 are further described hereinbelow with reference to Table 1.

[23227] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM519 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM519 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23228] As mentioned hereinabove with reference to Fig. 1, a function of VGAM519 gene, herein designated VGAM is inhibition of expression of VGAM519 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM519 correlate with, and may be deduced from, the identity of the target genes which VGAM519 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23229] Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM\_004170) is a VGAM519 host target gene. SLC1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A1 BINDING SITE, designated SEQ ID:10378, to the nucleotide sequence of VGAM519 RNA, herein designated VGAM RNA, also designated SEQ ID:3230.

[23230] A function of VGAM519 is therefore inhibition of Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM\_004170), a gene which is a glutamate transporter, essential for terminating the postsynaptic action of glutamate by rapidly removing it from the synaptic cleft. Accordingly, utilities of VGAM519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A1. The function of SLC1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM206.DKFZP566B183 (Accession NM\_015509) is another VGAM519 host target gene. DKFZP566B183 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566B183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566B183 BINDING SITE, designated SEQ ID:17766, to the nucleotide sequence of VGAM519 RNA, herein designated VGAM RNA, also designated SEQ ID:3230.

[23231] Another function of VGAM519 is therefore inhibition of DKFZP566B183 (Accession NM\_015509). Accordingly, utilities of VGAM519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566B183. FLJ00024 (Accession XM\_033361) is another VGAM519 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31886, to the

nucleotide sequence of VGAM519 RNA, herein designated VGAM RNA, also designated SEQ ID:3230.

[23232] Another function of VGAM519 is therefore inhibition of FLJ00024 (Accession XM\_033361). Accordingly, utilities of VGAM519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. RAB3-GAP150 (Accession NM\_012414) is another VGAM519 host target gene. RAB3-GAP150 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3-GAP150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3-GAP150 BINDING SITE, designated SEQ ID:14789, to the nucleotide sequence of VGAM519 RNA, herein designated VGAM RNA, also designated SEQ ID:3230.

[23233] Another function of VGAM519 is therefore inhibition of RAB3-GAP150 (Accession NM\_012414). Accordingly, utilities of VGAM519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3-GAP150. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic

Address Messenger 520 (VGAM520) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23234] VGAM520 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM520 was detected is described hereinabove with reference to Figs. 1–8.

[23235] VGAM520 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM520 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23236] VGAM520 gene encodes a VGAM520 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM520 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM520 precursor RNA is designated SEQ ID:506, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:506 is located at position 71198 relative to the genome of Lymphocystis Disease Virus 1.

[23237] VGAM520 precursor RNA folds onto itself, forming VGAM520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23238] An enzyme complex designated DICER COMPLEX, `dices` the VGAM520 folded precursor RNA into VGAM520 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM520 RNA is designated SEQ ID:3231, and is provided hereinbelow with reference to the sequence listing part.

[23239] VGAM520 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM520 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM520 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23240] VGAM520 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM520 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM520 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23241] The complementary binding of VGAM520 RNA, herein designated VGAM RNA, to host target binding sites on VGAM520 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM520 host target RNA into VGAM520 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23242] It is appreciated that VGAM520 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM520 host target genes. The mRNA of each one of this plurality of VGAM520 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM520 RNA, herein designated VGAM RNA, and which when bound by VGAM520 RNA causes inhibition of translation of respective one or more VGAM520 host target proteins.

[23243] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM520 gene, herein designated VGAM GENE, on one or more VGAM520 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23244] It is yet further appreciated that a function of VGAM520 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM520 include diagnosis, prevention and treatment of viral infection by Lymphocystis Disease Virus 1. Specific functions, and accordingly utilities, of VGAM520 correlate with, and may be deduced from, the

identity of the host target genes which VGAM520 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23245] Nucleotide sequences of the VGAM520 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM520 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM520 are further described hereinbelow with reference to Table 1.

[23246] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM520 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM520 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23247] As mentioned hereinabove with reference to Fig. 1, a function of VGAM520 gene, herein designated VGAM is inhibition of expression of VGAM520 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM520 correlate with, and may be deduced from, the identity of the target genes which VGAM520

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23248] Nuclear Antigen Sp100 (SP100, Accession NM\_003113) is a VGAM520 host target gene. SP100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SP100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP100 BINDING SITE, designated SEQ ID:9085, to the nucleotide sequence of VGAM520 RNA, herein designated VGAM RNA, also designated SEQ ID:3231.

[23249] A function of VGAM520 is therefore inhibition of Nuclear Antigen Sp100 (SP100, Accession NM\_003113), a gene which may be involved in transduction of interferon action. Accordingly, utilities of VGAM520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP100. The function of SP100 has been established by previous studies. Seeler et al. (1998) showed that SP100 complexes with members of the HP1 family of nonhistone chromosomal proteins (e.g., CBX5, 604478). A variant of SP100, termed SP100B by the authors, contains additional 3-prime sequence encoding a

688-amino acid protein. A splice variant of SP100B, termed SP100-HMG, is joined to an 81-amino acid HMG1 (OMIM Ref. No. 163905)-like peptide by a 14-amino acid bridge. The HMG1-like domain is 87% identical and 93% similar to HMG1. SP100-HMG has the potential to be a DNA-binding protein. All 3 variants, SP100, SP100B, and SP100-HMG, colocalize with HP1 in NBs, suggesting that the N-terminal portion of SP100 is responsible for the interaction. HP1 expression is enhanced when SP100 synthesis is induced by interferon. By Northern blot analysis, Dent et al. (1996) found that SP100B, which they called LYSP100, is expressed only in lymphoid tissues (spleen, tonsil, and thymus), mature B-cell lines, and some T-cell lines, but not in brain, liver, muscle, or nonlymphoid cell lines. They noted that SP100 expression is widespread. By confocal immunofluorescence microscopy, they determined that a minority of the nuclear dots for SP100B overlapped with SP100 and PML, whereas most localized to another class of subnuclear structures, which they termed LANDs (LYSP100-associated nuclear domains), which are morphologically and spatially distinct from PML NBs.

[23250] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [23251] Seeler, J. S.; Marchio, A.; Sitterlin, D.; Transy, C.; Dejean, A. : Interaction of SP100 with HP1 proteins: a link between the promyelocytic leukemia-associated nuclear bodies and the chromatin compartment. *Proc. Nat. Acad. Sci.* 95: 7316–7321, 1998. ; and
- [23252] Dent, A. L.; Yewdell, J.; Puvion-Dutilleul, F.; Koken, M. H.; de The, H.; Staudt, L. M. : LYSP100 associated nuclear domains (LANDs): description of a new class of subnuclear structures a.
- [23253] Further studies establishing the function and utilities of SP100 are found in John Hopkins OMIM database record ID 604585, and in cited publications numbered 4943–494 and 4547 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549) is another VGAM520 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13314, to the nucleotide sequence of VGAM520 RNA, herein designated VGAM RNA, also designated SEQ ID:3231.

[23254] Another function of VGAM520 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549). Accordingly, utilities of VGAM520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. KIAA0449 (Accession NM\_017596) is another VGAM520 host target gene. KIAA0449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0449 BINDING SITE, designated SEQ ID:19058, to the nucleotide sequence of VGAM520 RNA, herein designated VGAM RNA, also designated SEQ ID:3231.

[23255] Another function of VGAM520 is therefore inhibition of KIAA0449 (Accession NM\_017596). Accordingly, utilities of VGAM520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0449. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 521 (VGAM521) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23256] VGAM521 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM521 was detected is described hereinabove with reference to Figs. 1–8.

[23257] VGAM521 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23258] VGAM521 gene encodes a VGAM521 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM521 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM521 precursor RNA is designated SEQ ID:507, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:507 is located at position 75552 relative to the genome of Lymphocystis Disease Virus 1.

[23259] VGAM521 precursor RNA folds onto itself, forming VGAM521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23260] An enzyme complex designated DICER COMPLEX, `dices` the VGAM521 folded precursor RNA into VGAM521 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM521 RNA is designated SEQ ID:3232, and is provided hereinbelow with reference to the sequence listing part.

[23261] VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM521 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23262] VGAM521 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM521 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM521 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23263] The complementary binding of VGAM521 RNA, herein designated VGAM RNA, to host target binding sites on VGAM521 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM521 host target RNA into VGAM521 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23264] It is appreciated that VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM521 host target genes. The mRNA of each one of this plurality of VGAM521 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM521 RNA, herein designated VGAM RNA, and which when bound by VGAM521 RNA causes in-

hibition of translation of respective one or more VGAM521 host target proteins.

[23265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM521 gene, herein designated VGAM GENE, on one or more VGAM521 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23266] It is yet further appreciated that a function of VGAM521 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM521 include diagnosis, prevention and

treatment of viral infection by Lymphocystis Disease Virus

1. Specific functions, and accordingly utilities, of VGAM521 correlate with, and may be deduced from, the identity of the host target genes which VGAM521 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23267] Nucleotide sequences of the VGAM521 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM521 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM521 are further described hereinbelow with reference to Table 1.

[23268] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM521 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM521 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23269] As mentioned hereinabove with reference to Fig. 1, a function of VGAM521 gene, herein designated VGAM is inhibition of expression of VGAM521 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM521 correlate with, and may be deduced from, the identity of the target genes which VGAM521 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23270] Neuro-oncological Ventral Antigen 1 (NOVA1, Accession NM\_002515) is a VGAM521 host target gene. NOVA1 BINDING SITE1 and NOVA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NOVA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOVA1 BINDING SITE1 and NOVA1 BINDING SITE2, designated SEQ ID:8348 and SEQ ID:13217 respectively, to the nucleotide sequence of VGAM521 RNA, herein designated VGAM RNA, also designated SEQ ID:3232.

[23271] A function of VGAM521 is therefore inhibition of Neuro-oncological Ventral Antigen 1 (NOVA1, Accession NM\_002515), a gene which may regulate rna splicing or metabolism in a specific subset of developing neurons. Accordingly, utilities of VGAM521 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with NOVA1. The function of NOVA1 has been established by previous studies. Using antisera from patients with a paraneoplastic neurologic disorder involving the subcortical motor system, Buckanovich et al. (1993) identified a gene that they termed NOVA1. The NOVA1 gene encodes a neuron-specific RNA-binding protein that is inhibited by paraneoplastic antibodies (Buckanovich et al., 1996). Fletcher et al. (1997) showed that the mouse homolog maps to mouse chromosome 12 and suggested that the human gene is probably located on 14q. See also NOVA2 (OMIM Ref. No. 601991). Prestigiacomo et al. (2001) described a patient with a history of bladder carcinoma (OMIM Ref. No. 109800) who presented with the opsoclonus-ataxia syndrome. They demonstrated the presence of anti-Ri antibodies in the patient's serum and cerebrospinal fluid and found that the target Ri antigen was expressed in the original tumor specimen. This may have been the first instance of the syndrome with bladder cancer; it has been associated in children with neuroblastoma and in adults with breast carcinoma and gynecologic malignancies.

[23272] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [23273] Buckanovich, R. J.; Posner, J. B.; Darnell, R. B. : Nova, the paraneoplastic Ri antigen, is homologous to an RNA-binding protein and is specifically expressed in the developing motor system. *Neuron* 11: 657–672, 1993. ; and
- [23274] Prestigiacomo, C. J.; Balmaceda, C.; Dalmau, J. : Anti-Ri-associated paraneoplastic opsoclonus-ataxia syndrome in a man with transitional cell carcinoma: a case report. *Cancer* 91: 1423–.
- [23275] Further studies establishing the function and utilities of NOVA1 are found in John Hopkins OMIM database record ID 602157, and in cited publications numbered 5989–5990, 2386, 481 and 5991 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 522 (VGAM522) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [23276] VGAM522 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM522 was detected is described hereinabove with reference to Figs. 1–8.

[23277] VGAM522 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis Disease Virus 1. VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23278] VGAM522 gene encodes a VGAM522 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM522 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM522 precursor RNA is designated SEQ ID:508, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:508 is located at position 76141 relative to the genome of Lymphocystis Disease Virus 1.

[23279] VGAM522 precursor RNA folds onto itself, forming VGAM522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23280] An enzyme complex designated DICER COMPLEX, `dices` the VGAM522 folded precursor RNA into VGAM522 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM522 RNA is designated SEQ ID:3233, and is provided hereinbelow with reference to the sequence listing part.

[23281] VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM522 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23282] VGAM522 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM522 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM522 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23283] The complementary binding of VGAM522 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM522 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM522 host target RNA into VGAM522 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23284] It is appreciated that VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM522 host target genes. The mRNA of each one of this plurality of VGAM522 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM522 RNA, herein designated VGAM RNA, and which when bound by VGAM522 RNA causes inhibition of translation of respective one or more VGAM522 host target proteins.

[23285] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM522 gene, herein designated VGAM GENE, on one or more VGAM522 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23286] It is yet further appreciated that a function of VGAM522 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM522 include diagnosis, prevention and treatment of viral infection by Lymphocystis Disease Virus 1. Specific functions, and accordingly utilities, of VGAM522 correlate with, and may be deduced from, the identity of the host target genes which VGAM522 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23287] Nucleotide sequences of the VGAM522 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM522 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM522 are further described hereinbelow with reference to Table 1.

[23288] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM522 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM522 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23289] As mentioned hereinabove with reference to Fig. 1, a function of VGAM522 gene, herein designated VGAM is inhibition of expression of VGAM522 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM522 correlate with, and may be deduced from, the identity of the target genes which VGAM522 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23290] UDP-GlcNAc:betaGal Beta-

1,3-N-acetylglucosaminyltransferase 5 (B3GNT5, Accession NM\_032047) is a VGAM522 host target gene.

B3GNT5 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by B3GNT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT5 BINDING SITE, designated SEQ ID:25764, to the nucleotide sequence of VGAM522 RNA, herein designated VGAM RNA, also designated SEQ ID:3233.

[23291] A function of VGAM522 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 5 (B3GNT5, Accession NM\_032047). Accordingly, utilities of VGAM522 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT5. LOC154007 (Accession XM\_087824) is another VGAM522 host target gene. LOC154007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC154007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154007 BINDING SITE, designated SEQ ID:39457, to the nucleotide sequence of VGAM522 RNA, herein designated VGAM RNA, also designated SEQ ID:3233.

[23292] Another function of VGAM522 is therefore inhibition of LOC154007 (Accession XM\_087824). Accordingly, utilities of VGAM522 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154007. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 523 (VGAM523) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23293] VGAM523 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM523 was detected is described hereinabove with reference to Figs. 1–8.

[23294] VGAM523 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23295] VGAM523 gene encodes a VGAM523 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM523

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM523 precursor RNA is designated SEQ ID:509, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:509 is located at position 44554 relative to the genome of Murid Herpesvirus 4.

[23296] VGAM523 precursor RNA folds onto itself, forming VGAM523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23297] An enzyme complex designated DICER COMPLEX, `dices` the VGAM523 folded precursor RNA into VGAM523 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM523 RNA is designated SEQ ID:3234, and is provided hereinbelow with reference to the sequence listing part.

[23298] VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM523 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[23299] VGAM523 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM523 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM523 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23300] The complementary binding of VGAM523 RNA, herein designated VGAM RNA, to host target binding sites on VGAM523 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM523 host target RNA into VGAM523 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23301] It is appreciated that VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM523 host target genes. The mRNA of each one of this plurality of VGAM523 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM523 RNA, herein designated VGAM RNA, and which when bound by VGAM523 RNA causes inhibition of translation of respective one or more VGAM523 host target proteins.

[23302] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM523 gene, herein designated VGAM GENE, on one or more VGAM523 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23303] It is yet further appreciated that a function of VGAM523 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM523 correlate with, and may be deduced from, the identity of the host target genes which VGAM523 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23304] Nucleotide sequences of the VGAM523 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM523 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM523 are further described hereinbelow with reference to Table 1.

[23305] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM523 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM523 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[23306] As mentioned hereinabove with reference to Fig. 1, a function of VGAM523 gene, herein designated VGAM is inhibition of expression of VGAM523 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM523 correlate with, and may be deduced from, the identity of the target genes which VGAM523 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23307] Jumonji Homolog (mouse) (JMJ, Accession NM\_004973) is a VGAM523 host target gene. JMJ BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by JMJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JMJ BINDING SITE, designated SEQ ID:11418, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23308] A function of VGAM523 is therefore inhibition of Jumonji Homolog (mouse) (JMJ, Accession NM\_004973), a gene which participates in the negative regulation of cell growth. Accordingly, utilities of VGAM523 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with JMJ. The function of JMJ has been established by previous studies. Berge-Lefranc et al. (1996) isolated clones highly homologous to the mouse gene jumonji from a human embryonic cDNA library. In mouse, jumonji (jnj) is required for neural tube formation. Berge-Lefranc et al. (1996) reported that the human jumonji (JMJ) and mouse jnj gene products are 90% identical. Northern blot analysis revealed a low level of expression of JMJ in all human embryonic and adult tissues analyzed. In situ hybridization studies on embryonic slices revealed high levels of expression in dorsal root ganglia neurons. The authors detected high levels of expression in adult cerebral cortex. Toyoda et al. (2000) determined that JMJ is expressed as a 160-kD protein by Western blot analysis. Immunofluorescence and Western blot analysis demonstrated that JMJ specifically localizes to the cell nucleus. Overexpression of JMJ appeared to inhibit cell growth, whereas Jnj-deficient mice had cell growth enhancement. Berge-Lefranc et al. (1996) mapped the human JMJ gene to chromosome 6p24-p23 using autoradiographic in situ hybridization

[23309] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [23310] Berge-Lefranc, J.-L.; Jay, P.; Massacrier, A.; Cau, P.; Mattei, M. G.; Bauer, S.; Marsollier, C.; Berta, P.; Fontes, M. : Characterization of the human jumonji gene. Hum. Molec. Genet. 5: 1637-1641, 1996. ; and
- [23311] Toyoda, M.; Kojima, M.; Takeuchi, T. : Jumonji is a nuclear protein that participates in the negative regulation of cell growth. Biochem. Biophys. Res. Commun. 274: 332-336, 2000.
- [23312] Further studies establishing the function and utilities of JMJ are found in John Hopkins OMIM database record ID 601594, and in cited publications numbered 1286-1287 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010) is another VGAM523 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRCAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:11452, to the nucleotide se-

quence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23313] Another function of VGAM523 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM268.DKFZp564I1922 (Accession NM\_015419) is another VGAM523 host target gene. DKFZp564I1922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp564I1922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp564I1922 BINDING SITE, designated SEQ ID:17722, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23314] Another function of VGAM523 is therefore inhibition of

DKFZp564I1922 (Accession NM\_015419). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564I1922. FLJ10097 (Accession XM\_043653) is another VGAM523 host target gene. FLJ10097 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10097 BINDING SITE, designated SEQ ID:33988, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23315] Another function of VGAM523 is therefore inhibition of FLJ10097 (Accession XM\_043653). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10097. FLJ20276 (Accession NM\_017738) is another VGAM523 host target gene. FLJ20276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20276 BINDING SITE, designated SEQ ID:19327, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23316] Another function of VGAM523 is therefore inhibition of FLJ20276 (Accession NM\_017738). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20276. KIAA0825 (Accession XM\_027906) is another VGAM523 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:30592, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23317] Another function of VGAM523 is therefore inhibition of KIAA0825 (Accession XM\_027906). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. LOC149153 (Accession XM\_097599) is another

VGAM523 host target gene. LOC149153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149153 BINDING SITE, designated SEQ ID:40962, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23318] Another function of VGAM523 is therefore inhibition of LOC149153 (Accession XM\_097599). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149153. LOC200563 (Accession XM\_117251) is another VGAM523 host target gene. LOC200563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200563 BINDING SITE, designated SEQ ID:43318, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23319] Another function of VGAM523 is therefore inhibition of LOC200563 (Accession XM\_117251). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200563. LOC219627 (Accession XM\_166402) is another VGAM523 host target gene. LOC219627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219627 BINDING SITE, designated SEQ ID:44272, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23320] Another function of VGAM523 is therefore inhibition of LOC219627 (Accession XM\_166402). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219627. LOC221814 (Accession XM\_168226) is another VGAM523 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45088, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23321] Another function of VGAM523 is therefore inhibition of LOC221814 (Accession XM\_168226). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. LOC257415 (Accession XM\_171177) is another VGAM523 host target gene. LOC257415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257415 BINDING SITE, designated SEQ ID:45957, to the nucleotide sequence of VGAM523 RNA, herein designated VGAM RNA, also designated SEQ ID:3234.

[23322] Another function of VGAM523 is therefore inhibition of LOC257415 (Accession XM\_171177). Accordingly, utilities of VGAM523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257415. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 524 (VGAM524) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23323] VGAM524 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM524 was detected is described hereinabove with reference to Figs. 1–8.

[23324] VGAM524 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23325] VGAM524 gene encodes a VGAM524 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM524 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM524 precursor RNA is designated SEQ ID:510, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:510 is located at position 45166 relative to the genome of Murid Herpesvirus 4.

[23326] VGAM524 precursor RNA folds onto itself, forming VGAM524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23327] An enzyme complex designated DICER COMPLEX, `dices` the VGAM524 folded precursor RNA into VGAM524 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM524 RNA is designated SEQ ID:3235, and is provided hereinbelow with reference to the sequence listing part.

[23328] VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM524 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23329] VGAM524 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM524 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM524 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23330] The complementary binding of VGAM524 RNA, herein designated VGAM RNA, to host target binding sites on VGAM524 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM524 host target RNA into VGAM524 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23331] It is appreciated that VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM524 host target genes. The mRNA of each one of this plurality of VGAM524 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM524 RNA, herein designated VGAM RNA, and which when bound by VGAM524 RNA causes in-

hibition of translation of respective one or more VGAM524 host target proteins.

[23332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM524 gene, herein designated VGAM GENE, on one or more VGAM524 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23333] It is yet further appreciated that a function of VGAM524 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM524 include diagnosis, prevention and

treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM524 correlate with, and may be deduced from, the identity of the host target genes which VGAM524 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [23334] Nucleotide sequences of the VGAM524 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM524 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM524 are further described hereinbelow with reference to Table 1.
- [23335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM524 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM524 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [23336] As mentioned hereinabove with reference to Fig. 1, a function of VGAM524 gene, herein designated VGAM is inhibition of expression of VGAM524 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM524 correlate with, and may be deduced from, the identity of the target genes which VGAM524 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23337] Heterogeneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM\_002140) is a VGAM524 host target gene. HNRPK BINDING SITE1 and HNRPK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPK BINDING SITE1 and HNRPK BINDING SITE2, designated SEQ ID:7916 and SEQ ID:25280 respectively, to the nucleotide sequence of VGAM524 RNA, herein designated VGAM RNA, also designated SEQ ID:3235.

[23338] A function of VGAM524 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM\_002140), a gene which play a role in the nuclear metabolism of hnrnas, particularly for pre-mrnas that contain cytidine-rich sequence. Accordingly, utilities of VGAM524 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with HNRPK. The function of HNRPK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125.FLJ10546 (Accession XM\_002989) is another VGAM524 host target gene. FLJ10546 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10546 BINDING SITE, designated SEQ ID:29912, to the nucleotide sequence of VGAM524 RNA, herein designated VGAM RNA, also designated SEQ ID:3235.

[23339] Another function of VGAM524 is therefore inhibition of FLJ10546 (Accession XM\_002989). Accordingly, utilities of VGAM524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10546. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 525 (VGAM525) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[23340] VGAM525 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM525 was detected is described hereinabove with reference to Figs. 1–8.

[23341] VGAM525 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM525 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23342] VGAM525 gene encodes a VGAM525 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM525 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM525 precursor RNA is designated SEQ ID:511, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:511 is located at position 53388 relative to the genome of Murid Herpesvirus 4.

[23343] VGAM525 precursor RNA folds onto itself, forming VGAM525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[23344] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM525 folded precursor RNA into VGAM525 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 82%) nucleotide se-  
quence of VGAM525 RNA is designated SEQ ID:3236, and  
is provided hereinbelow with reference to the sequence  
listing part.

[23345] VGAM525 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM525 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM525 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[23346] VGAM525 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM525 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM525 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[23347] The complementary binding of VGAM525 RNA, herein designated VGAM RNA, to host target binding sites on VGAM525 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM525 host target RNA into VGAM525 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23348] It is appreciated that VGAM525 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM525 host target genes. The mRNA of each one of this plurality of VGAM525 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM525 RNA, herein designated VGAM RNA, and which when bound by VGAM525 RNA causes inhibition of translation of respective one or more VGAM525 host target proteins.

[23349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM525 gene, herein designated VGAM GENE, on one or

more VGAM525 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23350] It is yet further appreciated that a function of VGAM525 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM525 correlate with, and may be deduced from, the identity of the host target genes which VGAM525 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [23351] Nucleotide sequences of the VGAM525 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM525 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM525 are further described hereinbelow with reference to Table 1.
- [23352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM525 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM525 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [23353] As mentioned hereinabove with reference to Fig. 1, a function of VGAM525 gene, herein designated VGAM is inhibition of expression of VGAM525 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM525 correlate with, and may be deduced from, the identity of the target genes which VGAM525 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [23354] Amyloid Beta Precursor Protein (cytoplasmic tail) Binding

Protein 2 (APPBP2, Accession NM\_006380) is a VGAM525 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:13077, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23355] A function of VGAM525 is therefore inhibition of Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of APPBP2 has been established by previous studies. Epithelial cell surfaces are divided into apical and basolateral domains. The basolateral sorting of cell surface proteins depends on the presence of peptide-based basolateral sorting signals (BaSS) in the cytoplasmic domains of proteins. Amyloid precursor protein (APP; 104760), a basolat-

eral protein implicated in the pathogenesis of Alzheimer disease (AD; 104300), contains a tyrosine-based BaSS. Mutation of the tyrosine results in nonpolarized transport of APP. Using APP-BaSS as bait in a yeast 2-hybrid screen of a HeLa cell cDNA library, followed by negative selection with a tyr-ala mutant APP-BaSS as bait and 5-prime RACE, Zheng et al. (1998) isolated a cDNA encoding amyloid beta precursor protein-binding protein-2 (OMIM Ref. No. APPBP2), which they called PAT1 (protein interacting with APP tail-1). The deduced 585-amino acid hydrophilic APPBP2 protein, which is identical to the uncharacterized KIAA0228 protein identified by Nagase et al. (1996), lacks signal or transmembrane sequences but contains N- and C-terminal globular structures, a coiled coil domain, several protein kinase C phosphorylation sites, and 4 imperfect C-terminal tandem repeats. Binding analysis determined that APPBP2 binds specifically to the tyrosine-containing APP-BaSS and to the complete cytoplasmic domain of APP; it does not bind to mutant APP-BaSS. Western blot analysis showed that APPBP2 is present as a 70-kD protein in both cytosolic and, together with APP, membrane-associated cell fractions. Immunofluorescence microscopy demonstrated that APPBP2 is present in the

Golgi region and that its distribution overlaps that of APP. SDS-PAGE and immunoblotting showed that APPBP2 interacts with microtubules and is functionally associated with APP transport and/or processing. By Northern blot analysis, Nagase et al. (1996) detected ubiquitous expression of KIAA0228 as an approximately 6.5-kb transcript.

[23356] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23357] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201–KIAA0280) deduced by analysis of cDNA clones from cell line KG–1 and brain. DNA Res. 3: 321–329, 1996. ; and

[23358] Zheng, P.; Eastman, J.; Vande Pol, S.; Pimplikar, S. W. : PAT1, a microtubule-interacting protein, recognizes the basolateral sorting signal of amyloid precursor protein. Proc. Nat. Aca.

[23359] Further studies establishing the function and utilities of APPBP2 are found in John Hopkins OMIM database record ID 605324, and in cited publications numbered 680 and

9379 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chondroitin Sulfate Proteoglycan 4 (melanoma-associated) (CSPG4, Accession NM\_001897) is another VGAM525 host target gene. CSPG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSPG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSPG4 BINDING SITE, designated SEQ ID:7624, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23360] Another function of VGAM525 is therefore inhibition of Chondroitin Sulfate Proteoglycan 4 (melanoma-associated) (CSPG4, Accession NM\_001897), a gene which plays a role in stabilizing cell-substratum interactions. Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSPG4. The function of CSPG4 has been established by previous studies. By N-terminal micropeptide sequence analysis, screening a melanoma cell line with a rat NG2 chondroitin sulfate proteoglycan

probe, and anchored PCR, Pluschke et al. (1996) isolated a cDNA encoding CSPG4, which they called MCSP. The deduced 2,322-amino acid protein has a signal sequence; 3 N-terminal domains defined by cysteine content; 15 potential N-linked glycosylation sites; a transmembrane segment containing a single cysteine; and a 75-residue cytoplasmic domain with 3 potential phosphorylation sites. Northern blot analysis revealed expression of a 9.0-kb transcript in melanoma cells; expression was not found in other tumors or normal tissues. In situ hybridization analysis demonstrated expression of CSPG4 in cells that stained with MCSP-specific monoclonal antibodies Smith et al. (1996) described the expression of a 220- to 240-kD cell-surface chondroitin sulfate proteoglycan molecule, previously described on human melanoma cells, and by amino acid sequencing identified it as the human homolog of the rat NG2 chondroitin sulfate proteoglycan molecule. They found that is not expressed by normal hematopoietic cells but is selectively expressed by leukemic blast cells from a subpopulation of children with acute myeloid leukemia who have a poor prognosis. These AML blasts have abnormalities in chromosome band 11q23, the site of the MLL gene (OMIM Ref. No. 159555).

The authors hypothesized that the gene that encodes the NG2 molecule is controlled by a transcription factor encoded by the MLL gene and that certain types of alterations in MLL result in the aberrant expression of the NG2 molecule. Behm et al. (1996) studied 104 consecutive children at initial presentation with acute lymphoblastic leukemia and concluded that the cell surface expression of NG2 is useful for identifying patients who have t(4;11) or t(11;19) translocations

[23361] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23362] Pluschke, G.; Vanek, M.; Evans, A.; Dittmar, T.; Schmid, P.; Itin, P.; Filardo, E. J.; Reisfeld, R. A. : Molecular cloning of a human melanoma-associated chondroitin sulfate proteoglycan. Proc. Nat. Acad. Sci. 93: 9710–9715, 1996. ; and

[23363] Behm, F. G.; Smith, F. O.; Raimondi, S. C.; Pui, C.–H.; Bernstein, I. D. : Human homologue of the rat chondroitin sulfate proteoglycan, NG2, detected by monoclonal antibody 7.1, identified.

[23364] Further studies establishing the function and utilities of CSPG4 are found in John Hopkins OMIM database record ID 601172, and in cited publications numbered

9309–9313 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231) is another VGAM525 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14876, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23365] Another function of VGAM525 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Neural Precursor Cell Expressed,

Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129) is another VGAM525 host target gene. NEDD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4 BINDING SITE, designated SEQ ID:34690, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23366] Another function of VGAM525 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM\_046129), a gene which ubiquitinates regulatory proteins involved in transcription. Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4. The function of NEDD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM\_039259) is another VGAM525 host target gene. DOCK3 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33039, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23367] Another function of VGAM525 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM\_039259). Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. FLJ20457 (Accession NM\_017832) is another VGAM525 host target gene. FLJ20457 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20457 BINDING SITE, designated SEQ ID:19495, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23368] Another function of VGAM525 is therefore inhibition of FLJ20457 (Accession NM\_017832). Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20457. KIAA0293 (Accession XM\_027045) is another VGAM525 host target gene. KIAA0293 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0293 BINDING SITE, designated SEQ ID:30397, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23369] Another function of VGAM525 is therefore inhibition of KIAA0293 (Accession XM\_027045). Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0293. KIAA0542 (Accession XM\_038520) is another VGAM525 host target gene. KIAA0542 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0542, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0542 BINDING SITE, designated SEQ ID:32859, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23370] Another function of VGAM525 is therefore inhibition of KIAA0542 (Accession XM\_038520). Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0542. KIAA1322 (Accession XM\_052626) is another VGAM525 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36018, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23371] Another function of VGAM525 is therefore inhibition of KIAA1322 (Accession XM\_052626). Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1322. LOC144559 (Accession XM\_084896) is another VGAM525 host target gene. LOC144559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144559 BINDING SITE, designated SEQ ID:37763, to the nucleotide sequence of VGAM525 RNA, herein designated VGAM RNA, also designated SEQ ID:3236.

[23372] Another function of VGAM525 is therefore inhibition of LOC144559 (Accession XM\_084896). Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144559. LOC257041 (Accession XM\_173829) is another VGAM525 host target gene. LOC257041 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257041 BINDING SITE, designated SEQ ID:46563, to the nucleotide sequence of VGAM525 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3236.

[23373] Another function of VGAM525 is therefore inhibition of LOC257041 (Accession XM\_173829). Accordingly, utilities of VGAM525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257041. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 526 (VGAM526) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23374] VGAM526 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM526 was detected is described hereinabove with reference to Figs. 1–8.

[23375] VGAM526 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23376] VGAM526 gene encodes a VGAM526 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM526 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM526 precursor RNA is designated SEQ ID:512, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:512 is located at position 54037 relative to the genome of Murid Herpesvirus 4.

[23377] VGAM526 precursor RNA folds onto itself, forming VGAM526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23378] An enzyme complex designated DICER COMPLEX, `dices` the VGAM526 folded precursor RNA into VGAM526 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM526 RNA is designated SEQ ID:3237, and is provided hereinbelow with reference to the sequence listing part.

[23379] VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM526 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[23380] VGAM526 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM526 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM526 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23381] The complementary binding of VGAM526 RNA, herein designated VGAM RNA, to host target binding sites on VGAM526 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM526 host target RNA into VGAM526 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23382] It is appreciated that VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM526 host target genes. The mRNA of

each one of this plurality of VGAM526 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM526 RNA, herein designated VGAM RNA, and which when bound by VGAM526 RNA causes inhibition of translation of respective one or more VGAM526 host target proteins.

[23383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM526 gene, herein designated VGAM GENE, on one or more VGAM526 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[23384] It is yet further appreciated that a function of VGAM526 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM526 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM526 correlate with, and may be deduced from, the identity of the host target genes which VGAM526 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23385] Nucleotide sequences of the VGAM526 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM526 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM526 are further described hereinbelow with reference to Table 1.

[23386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM526 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM526 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[23387] As mentioned hereinabove with reference to Fig. 1, a function of VGAM526 gene, herein designated VGAM is inhibition of expression of VGAM526 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM526 correlate with, and may be deduced from, the identity of the target genes which VGAM526 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23388] LOC143888 (Accession XM\_084669) is a VGAM526 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37666, to the nucleotide sequence of VGAM526 RNA, herein designated VGAM RNA, also designated SEQ ID:3237.

[23389] A function of VGAM526 is therefore inhibition of LOC143888 (Accession XM\_084669). Accordingly, utilities of VGAM526 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC143888. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 527 (VGAM527) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23390] VGAM527 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM527 was detected is described hereinabove with reference to Figs. 1–8.

[23391] VGAM527 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM527 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23392] VGAM527 gene encodes a VGAM527 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM527 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM527 precursor RNA is designated SEQ

ID:513, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:513 is located at position 83822 relative to the genome of Murid Herpesvirus 4.

[23393] VGAM527 precursor RNA folds onto itself, forming VGAM527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23394] An enzyme complex designated DICER COMPLEX, `dices` the VGAM527 folded precursor RNA into VGAM527 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM527 RNA is designated SEQ ID:3238, and is provided hereinbelow with reference to the sequence

listing part.

[23395] VGAM527 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM527 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23396] VGAM527 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM527 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM527 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23397] The complementary binding of VGAM527 RNA, herein designated VGAM RNA, to host target binding sites on VGAM527 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM527 host target RNA into VGAM527 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23398] It is appreciated that VGAM527 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM527 host target genes. The mRNA of each one of this plurality of VGAM527 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM527 RNA, herein designated VGAM

RNA, and which when bound by VGAM527 RNA causes inhibition of translation of respective one or more VGAM527 host target proteins.

[23399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM527 gene, herein designated VGAM GENE, on one or more VGAM527 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23400] It is yet further appreciated that a function of VGAM527 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM527 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM527 correlate with, and may be deduced from, the identity of the host target genes which VGAM527 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23401] Nucleotide sequences of the VGAM527 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM527 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM527 are further described hereinbelow with reference to Table 1.

[23402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM527 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM527 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23403] As mentioned hereinabove with reference to Fig. 1, a function of VGAM527 gene, herein designated VGAM is

inhibition of expression of VGAM527 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM527 correlate with, and may be deduced from, the identity of the target genes which VGAM527 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23404] BLAME (Accession NM\_020125) is a VGAM527 host target gene. BLAME BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:21303, to the nucleotide sequence of VGAM527 RNA, herein designated VGAM RNA, also designated SEQ ID:3238.

[23405] A function of VGAM527 is therefore inhibition of BLAME (Accession NM\_020125). Accordingly, utilities of VGAM527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. LOC123242 (Accession XM\_063548) is another VGAM527 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of

mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37240, to the nucleotide sequence of VGAM527 RNA, herein designated VGAM RNA, also designated SEQ ID:3238.

[23406] Another function of VGAM527 is therefore inhibition of LOC123242 (Accession XM\_063548). Accordingly, utilities of VGAM527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC253001 (Accession XM\_171711) is another VGAM527 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46057, to the nucleotide sequence of VGAM527 RNA, herein designated VGAM RNA, also designated SEQ ID:3238.

[23407] Another function of VGAM527 is therefore inhibition of LOC253001 (Accession XM\_171711). Accordingly, utilities

of VGAM527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC254413 (Accession XM\_173141) is another VGAM527 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46403, to the nucleotide sequence of VGAM527 RNA, herein designated VGAM RNA, also designated SEQ ID:3238.

[23408] Another function of VGAM527 is therefore inhibition of LOC254413 (Accession XM\_173141). Accordingly, utilities of VGAM527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 528 (VGAM528) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23409] VGAM528 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM528 was detected is described hereinabove with reference to Figs. 1–8.

[23410] VGAM528 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM528 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23411] VGAM528 gene encodes a VGAM528 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM528 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM528 precursor RNA is designated SEQ ID:514, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:514 is located at position 97660 relative to the genome of Murid Herpesvirus 4.

[23412] VGAM528 precursor RNA folds onto itself, forming VGAM528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23413] An enzyme complex designated DICER COMPLEX, `dices` the VGAM528 folded precursor RNA into VGAM528 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM528 RNA is designated SEQ ID:3239, and is provided hereinbelow with reference to the sequence listing part.

[23414] VGAM528 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM528 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[23415] VGAM528 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM528 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM528 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23416] The complementary binding of VGAM528 RNA, herein designated VGAM RNA, to host target binding sites on VGAM528 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM528 host target RNA into VGAM528 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23417] It is appreciated that VGAM528 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM528 host target genes. The mRNA of each one of this plurality of VGAM528 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM528 RNA, herein designated VGAM RNA, and which when bound by VGAM528 RNA causes inhibition of translation of respective one or more VGAM528 host target proteins.

[23418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM528 gene, herein designated VGAM GENE, on one or more VGAM528 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23419] It is yet further appreciated that a function of VGAM528 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM528 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM528 correlate with, and may be deduced from, the identity of the host target genes which VGAM528 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23420] Nucleotide sequences of the VGAM528 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM528 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM528 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM528 are further  
described hereinbelow with reference to Table 1.

[23421] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM528 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM528 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[23422] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM528 gene, herein designated VGAM is  
inhibition of expression of VGAM528 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM528 correlate with, and may be deduced  
from, the identity of the target genes which VGAM528  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[23423] FAT Tumor Suppressor Homolog 1 (Drosophila) (FAT, Ac-  
cession NM\_005245) is a VGAM528 host target gene. FAT

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAT BINDING SITE, designated SEQ ID:11753, to the nucleotide sequence of VGAM528 RNA, herein designated VGAM RNA, also designated SEQ ID:3239.

[23424] A function of VGAM528 is therefore inhibition of FAT Tumor Suppressor Homolog 1 (Drosophila) (FAT, Accession NM\_005245), a gene which possibly functions in developmental processes and cell communication. Accordingly, utilities of VGAM528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT. The function of FAT has been established by previous studies. Cell-cell interactions that involve adhesion molecules are important in many developmental processes. Dunne et al. (1995) stated that many adhesion molecules have been found to be conserved between Drosophila and vertebrates, indicating that the adhesion molecules involved in tissue morphogenesis evolved long before the divergence of the arthropods and chordates Hortsch and Goodman, 1991). Adhesion molecules have

been classified into 4 major families: the immunoglobulin superfamily, the integrin superfamily, the selectin family, and the cadherin superfamily. Cadherins mediate homophilic, calcium-dependent cell-cell adhesion in a wide variety of tissues and are important regulators of morphogenesis, and loss of function may be involved in the invasion and metastasis of malignant tumors. The original or classical adherins have a highly conserved domain structure typically including 5 extracellular, conserved repeated amino acid sequences (cadherin repeats). The *Drosophila* 'fat' gene does not belong to the classical cadherin gene family yet encodes a transmembrane protein containing 34 cadherin repeats in association with a number of other motifs Mahoney et al. (1991). The *Drosophila* 'fat' locus encodes a tumor suppressor gene, and recessive (loss-of-function) mutations lead to hyperplastic overgrowth of the imaginal discs, indicating that contact-dependent cell interactions may play an important role in regulating growth (Bryant et al., 1988). This excessive cell proliferation occurs while maintaining normal epithelial organization and differentiation potential. Dunne et al. (1995) reported the sequence of a cDNA that was serendipitously obtained during a screen of a human T-

lymphocyte cDNA library. The full-length cDNA had the potential to encode a large protein that most resembled the *Drosophila* 'fat' protein in its possession of 34 cadherin repeats and other characteristics. Therefore, they named the gene and the gene product FAT. Analysis of the expression of FAT in fetal and adult tissues revealed that FAT mRNA is present in many epithelial and some endothelial and smooth muscle cells. The FAT gene was localized to 4q34-q35 by isotopic in situ hybridization. The authors commented that the molecule is probably important in mammalian developmental processes and cell communication. The large FAT protein was predicted to contain nearly 4600 residues

[23425] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23426] Hortsch, M.; Goodman, C. S. : Cell and substrate adhesion molecules in *Drosophila*. *Ann. Rev. Cell. Biol.* 7: 505-557, 1991. ; and

[23427] Mahoney, P. A.; Weber, U.; Onofrechuk, P.; Biessmann, H.; Bryant, P. J.; Goodman, C. S. : The fat tumor suppressor gene in *Drosophila* encodes a novel member of the cadherin gene superfa.

[23428] Further studies establishing the function and utilities of FAT are found in John Hopkins OMIM database record ID 600976, and in cited publications numbered 7800–7803 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase Kinase 1 (MAP2K1, Accession NM\_002755) is another VGAM528 host target gene. MAP2K1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2K1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K1 BINDING SITE, designated SEQ ID:8635, to the nucleotide sequence of VGAM528 RNA, herein designated VGAM RNA, also designated SEQ ID:3239.

[23429] Another function of VGAM528 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 1 (MAP2K1, Accession NM\_002755), a gene which is a signaling intermediate, may take part in cell transformation. Accordingly, utilities of VGAM528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K1. The function of MAP2K1 has been established by previous studies. Mitogen-activated protein

(MAP) kinases, also known as extracellular signal-regulated kinases (ERKs) (see OMIM Ref. No. PRKM1; 176948), are thought to act as an integration point for multiple biochemical signals because they are activated by a wide variety of extracellular signals, are rapidly phosphorylated on threonine and tyrosine residues, and are highly conserved in evolution (Crews et al., 1992). A critical protein kinase lies upstream of MAP kinase and stimulates the enzymatic activity of MAP kinase. Crews et al. (1992) cloned a mouse cDNA, denoted Mek1 (for Map/Erk kinase-1) by them, that encodes a member of this protein kinase family. The 393-amino acid, 43.5-kD protein is most closely related in size and sequence to the product encoded by the *byr1* gene of *S. pombe*. Crews et al. (1992) found that Mek1 protein expressed in bacteria phosphorylates the Erk gene product in vitro. They showed that the Mek1 gene is highly expressed in murine brain. Ryan et al. (2000) showed that inhibition of MEK1 blocks p53 (OMIM Ref. No. 191170)-induced NF-kappa-B activation and apoptosis but not cell cycle arrest. They demonstrated that p53 activates NF-kappa-B through the RAF/MEK1/p90(rsk) (see OMIM Ref. No. 601684) pathway rather than the TNFR1 (OMIM Ref. No. 191190)/TRAF2

(OMIM Ref. No. 601895)/IKK (e.g., 600664) pathway used by TNFA (OMIM Ref. No. 191160). To elucidate the mechanism through which MAPK signaling regulates the MYOD (OMIM Ref. No. 159970) family of transcription factors, Perry et al. (2001) investigated the role of the signaling intermediate MEK1 in myogenesis. Transfection of activated MEK1 strongly repressed gene activation and myogenic conversion by the MYOD family. This repression was not mediated by direct phosphorylation of MYOD or by changes in MYOD stability or subcellular distribution. Deletion mapping revealed that MEK1-mediated repression required the MYOD N-terminal transactivation domain. Moreover, activated MEK1 was nuclearly localized and bound a complex containing MYOD in a manner that was dependent on the presence of the MYOD N terminus. These data demonstrated that MEK1 signaling has a strong negative effect on MYOD activity via a mechanism involving binding of MEK1 to the nuclear MYOD transcriptional complex

[23430] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23431] Crews, C. M.; Alessandrini, A.; Erikson, R. L. : The primary

structure of MEK, a protein kinase that phosphorylates the ERK gene product. Science 258: 478–480, 1992. ; and

[23432] Perry, R. L. S.; Parker, M. H.; Rudnicki, M. A. : Activated MEK1 binds the nuclear MyoD transcriptional complex to repress transactivation. Molec. Cell 8: 291–301, 2001.

[23433] Further studies establishing the function and utilities of MAP2K1 are found in John Hopkins OMIM database record ID 176872, and in cited publications numbered 10344–10356 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0561 (Accession XM\_038150) is another VGAM528 host target gene. KIAA0561 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:32767, to the nucleotide sequence of VGAM528 RNA, herein designated VGAM RNA, also designated SEQ ID:3239.

[23434] Another function of VGAM528 is therefore inhibition of KIAA0561 (Accession XM\_038150). Accordingly, utilities of VGAM528 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0561. LOC120105 (Accession XM\_061864) is another VGAM528 host target gene. LOC120105 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC120105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120105 BINDING SITE, designated SEQ ID:37209, to the nucleotide sequence of VGAM528 RNA, herein designated VGAM RNA, also designated SEQ ID:3239.

[23435] Another function of VGAM528 is therefore inhibition of LOC120105 (Accession XM\_061864). Accordingly, utilities of VGAM528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120105. LOC129831 (Accession XM\_059376) is another VGAM528 host target gene. LOC129831 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC129831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129831 BINDING SITE, designated SEQ ID:36978, to

the nucleotide sequence of VGAM528 RNA, herein designated VGAM RNA, also designated SEQ ID:3239.

[23436] Another function of VGAM528 is therefore inhibition of LOC129831 (Accession XM\_059376). Accordingly, utilities of VGAM528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129831. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 529 (VGAM529) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23437] VGAM529 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM529 was detected is described hereinabove with reference to Figs. 1–8.

[23438] VGAM529 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM529 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23439] VGAM529 gene encodes a VGAM529 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM529 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM529 precursor RNA is designated SEQ ID:515, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:515 is located at position 102688 relative to the genome of Murid Herpesvirus 4.

[23440] VGAM529 precursor RNA folds onto itself, forming VGAM529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23441] An enzyme complex designated DICER COMPLEX, `dices` the VGAM529 folded precursor RNA into VGAM529 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM529 RNA is designated SEQ ID:3240, and is provided hereinbelow with reference to the sequence listing part.

[23442] VGAM529 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM529 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[23443] VGAM529 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM529 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM529 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23444] The complementary binding of VGAM529 RNA, herein designated VGAM RNA, to host target binding sites on VGAM529 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM529 host target RNA into VGAM529 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23445] It is appreciated that VGAM529 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM529 host target genes. The mRNA of each one of this plurality of VGAM529 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM529 RNA, herein designated VGAM RNA, and which when bound by VGAM529 RNA causes inhibition of translation of respective one or more VGAM529 host target proteins.

[23446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM529 gene, herein designated VGAM GENE, on one or more VGAM529 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[23447] It is yet further appreciated that a function of VGAM529 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM529 correlate with, and may be deduced from, the identity of the host target genes which VGAM529 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23448] Nucleotide sequences of the VGAM529 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM529 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM529 are further described hereinbelow with reference to Table 1.

[23449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM529 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM529 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23450] As mentioned hereinabove with reference to Fig. 1, a function of VGAM529 gene, herein designated VGAM is inhibition of expression of VGAM529 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM529 correlate with, and may be deduced from, the identity of the target genes which VGAM529 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23451] DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM\_113366) is a VGAM529 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42243, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23452] A function of VGAM529 is therefore inhibition of DNA

Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM\_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.

Fibroblast Growth Factor 5 (FGF5, Accession NM\_004464) is another VGAM529 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:10774 and SEQ ID:27001 respectively, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23453] Another function of VGAM529 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM\_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273) is another VGAM529 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10485, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23454] Another function of VGAM529 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273). Accordingly, utilities of VGAM529

include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. FLJ10713 (Accession NM\_018189) is another VGAM529 host target gene. FLJ10713 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:20041, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23455] Another function of VGAM529 is therefore inhibition of FLJ10713 (Accession NM\_018189). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713. FLJ12363 (Accession NM\_032167) is another VGAM529 host target gene. FLJ12363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12363 BINDING SITE,

designated SEQ ID:25867, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23456] Another function of VGAM529 is therefore inhibition of FLJ12363 (Accession NM\_032167). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12363. FLJ12973 (Accession NM\_024908) is another VGAM529 host target gene. FLJ12973 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12973 BINDING SITE, designated SEQ ID:24407, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23457] Another function of VGAM529 is therefore inhibition of FLJ12973 (Accession NM\_024908). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12973. FLJ22684 (Accession NM\_025048) is another VGAM529 host target gene. FLJ22684 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ22684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22684 BINDING SITE, designated SEQ ID:24643, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23458] Another function of VGAM529 is therefore inhibition of FLJ22684 (Accession NM\_025048). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22684. FLJ31101 (Accession NM\_017964) is another VGAM529 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19684, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23459] Another function of VGAM529 is therefore inhibition of

FLJ31101 (Accession NM\_017964). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. KIAA0513 (Accession NM\_014732) is another VGAM529 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16357, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23460] Another function of VGAM529 is therefore inhibition of KIAA0513 (Accession NM\_014732). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. MDS018 (Accession NM\_021823) is another VGAM529 host target gene. MDS018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDS018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MDS018 BINDING SITE, designated SEQ ID:22402, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23461] Another function of VGAM529 is therefore inhibition of MDS018 (Accession NM\_021823). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS018. MGC11386 (Accession NM\_032933) is another VGAM529 host target gene. MGC11386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11386 BINDING SITE, designated SEQ ID:26756, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23462] Another function of VGAM529 is therefore inhibition of MGC11386 (Accession NM\_032933). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11386. MGC15416 (Accession NM\_138418) is an-

other VGAM529 host target gene. MGC15416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15416 BINDING SITE, designated SEQ ID:28788, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23463] Another function of VGAM529 is therefore inhibition of MGC15416 (Accession NM\_138418). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15416. MGC2474 (Accession NM\_023931) is another VGAM529 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23417, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23464] Another function of VGAM529 is therefore inhibition of MGC2474 (Accession NM\_023931). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474. PRO2389 (Accession XM\_033334) is another VGAM529 host target gene. PRO2389 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2389 BINDING SITE, designated SEQ ID:31880, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23465] Another function of VGAM529 is therefore inhibition of PRO2389 (Accession XM\_033334). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2389. Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM\_130842) is another VGAM529 host target gene. PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PT-

PRN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2, designated SEQ ID:28371 and SEQ ID:28376 respectively, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23466] Another function of VGAM529 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM\_130842). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN2. LOC146909 (Accession XM\_085634) is another VGAM529 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38267, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23467] Another function of VGAM529 is therefore inhibition of LOC146909 (Accession XM\_085634). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909. LOC152313 (Accession XM\_098190) is another VGAM529 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:41476, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23468] Another function of VGAM529 is therefore inhibition of LOC152313 (Accession XM\_098190). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC154877 (Accession XM\_098626) is another VGAM529 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41742, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23469] Another function of VGAM529 is therefore inhibition of LOC154877 (Accession XM\_098626). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC169026 (Accession XM\_095471) is another VGAM529 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40265, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23470] Another function of VGAM529 is therefore inhibition of LOC169026 (Accession XM\_095471). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC169026. LOC200014 (Accession XM\_114087) is another VGAM529 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42691, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23471] Another function of VGAM529 is therefore inhibition of LOC200014 (Accession XM\_114087). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC254439 (Accession XM\_170659) is another VGAM529 host target gene. LOC254439 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254439 BINDING SITE, designated SEQ ID:45432, to the nucleotide sequence of VGAM529 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3240.

[23472] Another function of VGAM529 is therefore inhibition of LOC254439 (Accession XM\_170659). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254439. LOC57107 (Accession NM\_020381) is another VGAM529 host target gene. LOC57107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, designated SEQ ID:21649, to the nucleotide sequence of VGAM529 RNA, herein designated VGAM RNA, also designated SEQ ID:3240.

[23473] Another function of VGAM529 is therefore inhibition of LOC57107 (Accession NM\_020381). Accordingly, utilities of VGAM529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 530 (VGAM530) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23474] VGAM530 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM530 was detected is described hereinabove with reference to Figs. 1–8.

[23475] VGAM530 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Common Chimpanzee Papillomavirus 1. VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23476] VGAM530 gene encodes a VGAM530 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM530 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM530 precursor RNA is designated SEQ ID:516, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:516 is located at position 2882 relative to the genome of Common Chimpanzee Papillomavirus 1.

[23477] VGAM530 precursor RNA folds onto itself, forming

VGAM530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23478] An enzyme complex designated DICER COMPLEX, `dices` the VGAM530 folded precursor RNA into VGAM530 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM530 RNA is designated SEQ ID:3241, and is provided hereinbelow with reference to the sequence listing part.

[23479] VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM530 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23480] VGAM530 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM530 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM530 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23481] The complementary binding of VGAM530 RNA, herein designated VGAM RNA, to host target binding sites on VGAM530 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM530 host target RNA into VGAM530 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23482] It is appreciated that VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM530 host target genes. The mRNA of each one of this plurality of VGAM530 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM530 RNA, herein designated VGAM RNA, and which when bound by VGAM530 RNA causes inhibition of translation of respective one or more VGAM530 host target proteins.

[23483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM530 gene, herein designated VGAM GENE, on one or more VGAM530 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23484] It is yet further appreciated that a function of VGAM530 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of viral infection by Common Chimpanzee Papillomavirus 1. Specific functions, and accordingly utilities, of VGAM530 correlate with, and may be deduced from, the identity of the host target genes which

VGAM530 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23485] Nucleotide sequences of the VGAM530 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM530 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM530 are further described hereinbelow with reference to Table 1.

[23486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM530 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM530 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23487] As mentioned hereinabove with reference to Fig. 1, a function of VGAM530 gene, herein designated VGAM is inhibition of expression of VGAM530 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM530 correlate with, and may be deduced from, the identity of the target genes which VGAM530 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[23488] 5'-nucleotidase, Cytosolic II (NT5C2, Accession NM\_012229) is a VGAM530 host target gene. NT5C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NT5C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5C2 BINDING SITE, designated SEQ ID:14527, to the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, also designated SEQ ID:3241.

[23489] A function of VGAM530 is therefore inhibition of 5'-nucleotidase, Cytosolic II (NT5C2, Accession NM\_012229). Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C2. Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM\_038377) is another VGAM530 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ROCK2 BINDING SITE, designated SEQ ID:32838, to the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, also designated SEQ ID:3241.

[23490] Another function of VGAM530 is therefore inhibition of Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM\_038377), a gene which regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273.FLJ13852 (Accession NM\_023078) is another VGAM530 host target gene. FLJ13852 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13852 BINDING SITE, designated SEQ ID:23339, to the nucleotide sequence of VGAM530 RNA, herein designated

VGAM RNA, also designated SEQ ID:3241.

[23491] Another function of VGAM530 is therefore inhibition of FLJ13852 (Accession NM\_023078). Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13852. FLJ23563 (Accession XM\_041701) is another VGAM530 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33561, to the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, also designated SEQ ID:3241.

[23492] Another function of VGAM530 is therefore inhibition of FLJ23563 (Accession XM\_041701). Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563. KIAA0161 (Accession NM\_014746) is another VGAM530 host target gene. KIAA0161 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0161, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0161 BINDING SITE, designated SEQ ID:16430, to the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, also designated SEQ ID:3241.

[23493] Another function of VGAM530 is therefore inhibition of KIAA0161 (Accession NM\_014746). Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0161. LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM\_018697) is another VGAM530 host target gene. LANCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL2 BINDING SITE, designated SEQ ID:20775, to the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, also designated SEQ ID:3241.

[23494] Another function of VGAM530 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 2

(bacterial) (LANCL2, Accession NM\_018697). Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL2. MAP (Accession NM\_022818) is another VGAM530 host target gene. MAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP BINDING SITE, designated SEQ ID:23095, to the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, also designated SEQ ID:3241.

[23495] Another function of VGAM530 is therefore inhibition of MAP (Accession NM\_022818). Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP. LOC221421 (Accession XM\_166428) is another VGAM530 host target gene. LOC221421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC221421 BINDING SITE, designated SEQ ID:44322, to the nucleotide sequence of VGAM530 RNA, herein designated VGAM RNA, also designated SEQ ID:3241.

[23496] Another function of VGAM530 is therefore inhibition of LOC221421 (Accession XM\_166428). Accordingly, utilities of VGAM530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221421. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 531 (VGAM531) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23497] VGAM531 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM531 was detected is described hereinabove with reference to Figs. 1–8.

[23498] VGAM531 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 4. VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[23499] VGAM531 gene encodes a VGAM531 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM531 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM531 precursor RNA is designated SEQ ID:517, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:517 is located at position 130187 relative to the genome of Equine Herpesvirus 4.

[23500] VGAM531 precursor RNA folds onto itself, forming VGAM531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23501] An enzyme complex designated DICER COMPLEX, `dices` the VGAM531 folded precursor RNA into VGAM531 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM531 RNA is designated SEQ ID:3242, and is provided hereinbelow with reference to the sequence listing part.

[23502] VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM531 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23503] VGAM531 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM531 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM531 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23504] The complementary binding of VGAM531 RNA, herein designated VGAM RNA, to host target binding sites on VGAM531 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM531 host target RNA into VGAM531 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23505] It is appreciated that VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM531 host target genes. The mRNA of each one of this plurality of VGAM531 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM531 RNA, herein designated VGAM RNA, and which when bound by VGAM531 RNA causes inhibition of translation of respective one or more VGAM531 host target proteins.

[23506] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM531 gene, herein designated VGAM GENE, on one or more VGAM531 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23507] It is yet further appreciated that a function of VGAM531 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM531 correlate with, and may be deduced from, the identity of the host target genes which VGAM531 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23508] Nucleotide sequences of the VGAM531 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM531 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM531 are further described hereinbelow with reference to Table 1.

[23509] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM531 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM531 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23510] As mentioned hereinabove with reference to Fig. 1, a function of VGAM531 gene, herein designated VGAM is inhibition of expression of VGAM531 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM531 correlate with, and may be deduced from, the identity of the target genes which VGAM531 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23511] Potassium Voltage-gated Channel, Delayed-rectifier, Sub-family S, Member 3 (KCNS3, Accession NM\_002252) is a VGAM531 host target gene. KCNS3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS3 BINDING SITE, designated SEQ ID:8050, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3242.

[23512] A function of VGAM531 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 3 (KCNS3, Accession NM\_002252). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS3. Myotubularin Related Protein 2 (MTMR2, Accession NM\_016156) is another VGAM531 host target gene. MTMR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR2 BINDING SITE, designated SEQ ID:18246, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23513] Another function of VGAM531 is therefore inhibition of Myotubularin Related Protein 2 (MTMR2, Accession NM\_016156). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR2. FLJ10052 (Accession NM\_017982) is another VGAM531 host target

gene. FLJ10052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10052 BINDING SITE, designated SEQ ID:19712, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23514] Another function of VGAM531 is therefore inhibition of FLJ10052 (Accession NM\_017982). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10052. G4 (Accession XM\_165712) is another VGAM531 host target gene. G4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G4 BINDING SITE, designated SEQ ID:43736, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23515] Another function of VGAM531 is therefore inhibition of G4

(Accession XM\_165712). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G4.

KIAA1246 (Accession XM\_166372) is another VGAM531 host target gene. KIAA1246 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1246 BINDING SITE, designated SEQ ID:44193, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23516] Another function of VGAM531 is therefore inhibition of KIAA1246 (Accession XM\_166372). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1246. RALGPS1A (Accession NM\_014636) is another VGAM531 host target gene. RALGPS1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16019, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23517] Another function of VGAM531 is therefore inhibition of RALGPS1A (Accession NM\_014636). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALGPS1A. LOC158337 (Accession XM\_098926) is another VGAM531 host target gene. LOC158337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158337 BINDING SITE, designated SEQ ID:41961, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23518] Another function of VGAM531 is therefore inhibition of LOC158337 (Accession XM\_098926). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158337. LOC200261 (Accession XM\_114172) is an-

other VGAM531 host target gene. LOC200261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200261 BINDING SITE, designated SEQ ID:42752, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23519] Another function of VGAM531 is therefore inhibition of LOC200261 (Accession XM\_114172). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200261. LOC203292 (Accession XM\_117527) is another VGAM531 host target gene. LOC203292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203292 BINDING SITE, designated SEQ ID:43503, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23520] Another function of VGAM531 is therefore inhibition of LOC203292 (Accession XM\_117527). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203292. LOC219744 (Accession XM\_166123) is another VGAM531 host target gene. LOC219744 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219744 BINDING SITE, designated SEQ ID:43903, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23521] Another function of VGAM531 is therefore inhibition of LOC219744 (Accession XM\_166123). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219744. LOC221479 (Accession XM\_166417) is another VGAM531 host target gene. LOC221479 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221479, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221479 BINDING SITE, designated SEQ ID:44289, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23522] Another function of VGAM531 is therefore inhibition of LOC221479 (Accession XM\_166417). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221479. LOC257554 (Accession XM\_175149) is another VGAM531 host target gene. LOC257554 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257554 BINDING SITE, designated SEQ ID:46643, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23523] Another function of VGAM531 is therefore inhibition of LOC257554 (Accession XM\_175149). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257554. LOC92973 (Accession XM\_048529) is another VGAM531 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35188, to the nucleotide sequence of VGAM531 RNA, herein designated VGAM RNA, also designated SEQ ID:3242.

[23524] Another function of VGAM531 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities of VGAM531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 532 (VGAM532) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23525] VGAM532 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM532 was detected is described hereinabove with reference to Figs. 1–8.

[23526] VGAM532 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Hepatitis Virus. VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23527] VGAM532 gene encodes a VGAM532 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM532 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM532 precursor RNA is designated SEQ ID:518, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:518 is located at position 27967 relative to the genome of Murine Hepatitis Virus.

[23528] VGAM532 precursor RNA folds onto itself, forming VGAM532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23529] An enzyme complex designated DICER COMPLEX, `dices` the VGAM532 folded precursor RNA into VGAM532 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM532 RNA is designated SEQ ID:3243, and is provided hereinbelow with reference to the sequence listing part.

[23530] VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM532 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23531] VGAM532 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM532 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM532 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23532] The complementary binding of VGAM532 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM532 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM532 host target RNA into VGAM532 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23533] It is appreciated that VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM532 host target genes. The mRNA of each one of this plurality of VGAM532 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM532 RNA, herein designated VGAM RNA, and which when bound by VGAM532 RNA causes inhibition of translation of respective one or more VGAM532 host target proteins.

[23534] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM532 gene, herein designated VGAM GENE, on one or more VGAM532 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23535] It is yet further appreciated that a function of VGAM532 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of viral infection by Murine Hepatitis Virus. Specific functions, and accordingly utilities, of VGAM532 correlate with, and may be deduced from, the identity of the host target genes which VGAM532 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23536] Nucleotide sequences of the VGAM532 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM532 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM532 are further described hereinbelow with reference to Table 1.

[23537] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM532 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM532 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23538] As mentioned hereinabove with reference to Fig. 1, a function of VGAM532 gene, herein designated VGAM is inhibition of expression of VGAM532 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM532 correlate with, and may be deduced from, the identity of the target genes which VGAM532 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23539] Chemokine-like Receptor 1 (CMKLR1, Accession NM\_004072) is a VGAM532 host target gene. CMKLR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CMKLR1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMKLR1 BINDING SITE, designated SEQ ID:10275, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23540] A function of VGAM532 is therefore inhibition of Chemokine-like Receptor 1 (CMKLR1, Accession NM\_004072), a gene which may have a function in bone metabolism. Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMKLR1. The function of CMKLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM237.LENG4 (Accession NM\_024298) is another VGAM532 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE,

designated SEQ ID:23579, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23541] Another function of VGAM532 is therefore inhibition of LENG4 (Accession NM\_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM\_035037) is another VGAM532 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ ID:32194, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23542] Another function of VGAM532 is therefore inhibition of

Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM\_035037). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. SRY (sex determining region Y)-box 10 (SOX10, Accession NM\_006941) is another VGAM532 host target gene. SOX10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX10 BINDING SITE, designated SEQ ID:13826, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23543] Another function of VGAM532 is therefore inhibition of SRY (sex determining region Y)-box 10 (SOX10, Accession NM\_006941). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX10. Fidgetin (FIGN, Accession XM\_171005) is another VGAM532 host target gene. FIGN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

FIGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FIGN BINDING SITE, designated SEQ ID:45777, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23544] Another function of VGAM532 is therefore inhibition of Fidgetin (FIGN, Accession XM\_171005). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIGN. KIAA0759 (Accession XM\_041090) is another VGAM532 host target gene. KIAA0759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0759 BINDING SITE, designated SEQ ID:33441, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23545] Another function of VGAM532 is therefore inhibition of KIAA0759 (Accession XM\_041090). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0759. KIAA1058 (Accession XM\_090586) is another VGAM532 host target gene. KIAA1058 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1058 BINDING SITE, designated SEQ ID:40012, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23546] Another function of VGAM532 is therefore inhibition of KIAA1058 (Accession XM\_090586). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1058. Sorting Nexin 10 (SNX10, Accession NM\_013322) is another VGAM532 host target gene. SNX10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX10 BINDING SITE, designated SEQ

ID:14968, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23547] Another function of VGAM532 is therefore inhibition of Sorting Nexin 10 (SNX10, Accession NM\_013322). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX10. LOC146714 (Accession XM\_097072) is another VGAM532 host target gene. LOC146714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146714 BINDING SITE, designated SEQ ID:40722, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23548] Another function of VGAM532 is therefore inhibition of LOC146714 (Accession XM\_097072). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146714. LOC150142 (Accession XM\_086791) is another VGAM532 host target gene. LOC150142 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38854, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23549] Another function of VGAM532 is therefore inhibition of LOC150142 (Accession XM\_086791). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC150696 (Accession NM\_144707) is another VGAM532 host target gene. LOC150696 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150696 BINDING SITE, designated SEQ ID:29531, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23550] Another function of VGAM532 is therefore inhibition of

LOC150696 (Accession NM\_144707). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150696. LOC220980 (Accession XM\_167629) is another VGAM532 host target gene. LOC220980 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:44738, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23551] Another function of VGAM532 is therefore inhibition of LOC220980 (Accession XM\_167629). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220980. LOC92539 (Accession XM\_045632) is another VGAM532 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34504, to the nucleotide sequence of VGAM532 RNA, herein designated VGAM RNA, also designated SEQ ID:3243.

[23552] Another function of VGAM532 is therefore inhibition of LOC92539 (Accession XM\_045632). Accordingly, utilities of VGAM532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 533 (VGAM533) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23553] VGAM533 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM533 was detected is described hereinabove with reference to Figs. 1–8.

[23554] VGAM533 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip Vein-clearing Virus. VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[23555] VGAM533 gene encodes a VGAM533 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM533 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM533 precursor RNA is designated SEQ ID:519, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:519 is located at position 4883 relative to the genome of Turnip Vein-clearing Virus.

[23556] VGAM533 precursor RNA folds onto itself, forming VGAM533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23557] An enzyme complex designated DICER COMPLEX, `dices` the VGAM533 folded precursor RNA into VGAM533 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM533 RNA is designated SEQ ID:3244, and is provided hereinbelow with reference to the sequence listing part.

[23558] VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM533 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23559] VGAM533 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM533 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM533 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23560] The complementary binding of VGAM533 RNA, herein designated VGAM RNA, to host target binding sites on VGAM533 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM533 host target RNA into VGAM533 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23561] It is appreciated that VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM533 host target genes. The mRNA of each one of this plurality of VGAM533 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM533 RNA, herein designated VGAM RNA, and which when bound by VGAM533 RNA causes inhibition of translation of respective one or more VGAM533 host target proteins.

[23562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM533 gene, herein designated VGAM GENE, on one or more VGAM533 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23563] It is yet further appreciated that a function of VGAM533 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of viral infection by Turnip Vein-clearing Virus. Specific functions, and accordingly utilities, of VGAM533 correlate with, and may be deduced from, the identity of the host target genes which VGAM533 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23564] Nucleotide sequences of the VGAM533 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM533 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM533 are further described hereinbelow with reference to Table 1.

[23565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM533 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM533 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23566] As mentioned hereinabove with reference to Fig. 1, a function of VGAM533 gene, herein designated VGAM is inhibition of expression of VGAM533 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM533 correlate with, and may be deduced from, the identity of the target genes which VGAM533 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23567] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM\_116974) is a VGAM533 host target gene. AKAP13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43176, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23568] A function of VGAM533 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM\_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17.BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM\_021813) is another VGAM533 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:22376, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23569] Another function of VGAM533 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcrip-

tion Factor 2 (BACH2, Accession NM\_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331. Cannabinoid Receptor 1 (brain) (CNR1, Accession NM\_016083) is another VGAM533 host target gene. CNR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNR1 BINDING SITE, designated SEQ ID:18165, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23570] Another function of VGAM533 is therefore inhibition of Cannabinoid Receptor 1 (brain) (CNR1, Accession NM\_016083), a gene which is involved in the cannabinoid-induced CNS effects. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with CNR1. The function of CNR1 has been established by previous studies. Ledent et al. (1999) investigated the function of the central cannabinoid receptor (CB1) by disrupting the gene in mice. Mutant mice did not respond to cannabinoid drugs, demonstrating the exclusive role of CB1 in mediating analgesia, reinforcement, hypothermia, hypolocomotion, and hypotension. The acute effects of opiates were unaffected, but the reinforcing properties of morphine and the severity of the withdrawal syndrome were strongly reduced. These observations suggested that CB1 is involved in the motivational properties of opiates and in the development of physical dependence, and extended the concept of an interconnected role of CB1 and opiate receptors in the brain areas mediating addictive behavior. The cannabinoids are psychoactive ingredients of marijuana, principally delta-9-tetrahydrocannabinol, as well as the synthetic analogs. Matsuda et al. (1990) cloned a cannabinoid receptor from a rat brain. Gerard et al. (1991) isolated a cDNA encoding a cannabinoid receptor from a human brain stem cDNA library. The deduced amino acid sequence encoded a protein of 472 residues which shared 97.3% identity with the rat cannabinoid receptor cloned by

Matsuda et al. (1990). They provided evidence for the existence of an identical cannabinoid receptor expressed in human testis. Animal model experiments lend further support to the function of CNR1. Di Marzo et al. (2001) showed that following temporary food restriction, CB1 receptor knockout mice eat less than their wildtype littermates, and the CB1 antagonist SR141716A reduces food intake in wildtype but not knockout mice. Furthermore, defective leptin (OMIM Ref. No. 164160) signaling is associated with elevated hypothalamic, but not cerebellar, levels of endocannabinoids in obese db/db and ob/ob mice and Zucker rats. Acute leptin treatment of normal rats and ob/ob mice reduces anandamide and 2-arachidonoyl glycerol in the hypothalamus. Di Marzo et al. (2001) concluded that endocannabinoids in the hypothalamus may tonically activate CB1 receptors to maintain food intake and form part of the neural circuitry regulated by leptin.

[23571] It is appreciated that the abovementioned animal model for CNR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[23572] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [23573] Ledent, C.; Valverde, O.; Cossu, G.; Petitet, F.; Aubert, J.-F.; Beslot, F.; Bohme, G. A.; Imperato, A.; Pedrazzini, T.; Roques, B. P.; Vassart, G.; Fratta, W.; Parmentier, M. : Unresponsiveness to cannabinoids and reduced addictive effects of opiates in CB(1) receptor knockout mice. *Science* 283: :401–404, 1999. ; and
- [23574] Gerard, C. M.; Mollereau, C.; Vassart, G.; Parmentier, M. : Molecular cloning of a human cannabinoid receptor which is also expressed in testis. *Biochem. J.* 279: 129–134, 1991.
- [23575] Further studies establishing the function and utilities of CNR1 are found in John Hopkins OMIM database record ID 114610, and in cited publications numbered 3702–3709 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM\_004397) is another VGAM533 host target gene. DDX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen–

tarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:10641, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23576] Another function of VGAM533 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM\_004397), a gene which is putative RNA helicases. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX6. The function of DDX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179.Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398) is another VGAM533 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40332, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23577] Another function of VGAM533 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444. EphB2 (EPHB2, Accession NM\_004442) is another VGAM533 host target gene. EPHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB2 BINDING SITE, designated SEQ ID:10731, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23578] Another function of VGAM533 is therefore inhibition of EphB2 (EPHB2, Accession NM\_004442), a gene which Eph-related receptor tyrosine kinase B2; may have a role in neurogenesis. Accordingly, utilities of VGAM533 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB2. The function of EPHB2 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins. Chan and Watt (1991) cloned partial sequences of the EEK (EPHA8; 176945) and ERK genes encoding members of the EPH subclass of receptor protein-tyrosine kinases. Northern blot analysis of rat RNA showed that DNA encoding human ERK hybridized to transcripts most abundantly in lung. By screening a human fetal brain cDNA expression library using a monoclonal antiphosphotyrosine antibody and by 5-prime RACE (rapid amplification of cDNA ends) procedures, Ikegaki et al. (1995) isolated overlapping cDNAs encoding a receptor-type tyrosine kinase belonging to the EPH family and designated the gene DRT (for developmentally regulated EPH-related tyrosine kinase). The DRT gene is expressed in transcripts of 3 different sizes (4, 5, and 11 kb). The DRT transcripts are expressed in human brain and several other tissues, including heart, lung, kidney, placenta, pancreas, liver, and skeletal muscle, but the 11-kb DRT transcript is preferentially expressed in fetal brain. Steady-state levels of DRT mRNA in several tissues, including brain, heart, lung,

and kidney, are greater in the midterm fetus than those in the adult. Ikegaki et al. (1995) showed that a large number of tumor cell lines derived from neuroectoderm express DRT transcripts. The authors speculated that DRT may play a part in human neurogenesis. Using a yeast 2-hybrid system, Cowan et al. (2000) demonstrated that PDZ domain-containing protein Pick1 (PRKCABP; 605926) binds the C-terminal tail of EphB2. Using colocalization studies and biochemical analysis, they demonstrated that a protein complex containing EphB2 and aquaporin-1 (AQP1; 107776) is formed in vivo. They concluded that Ephb2 may regulate ionic homeostasis and endolymph fluid production through macromolecular associations with membrane channels that transport chloride, bicarbonate, and water. Chan and Watt (1991) mapped the EEK and ERK genes to chromosome 1 by Southern blot analysis of somatic cell hybrids. Ikegaki et al. (1995) mapped DRT, the EPHB2 gene, to 1p36.1-p35 by PCR screening of human/rodent somatic cell hybrid panels and by fluorescence in situ hybridization. As the distal end of 1p is often deleted in neuroblastomas, the DRT gene may play a role in neuroblastoma and small cell lung carcinoma (SCLC) tumorigenesis. By fluorescence in situ hybridization, Saito

et al. (1995) demonstrated that the ERK gene is located in chromosomal region 1p36.1. They showed that the homologous genes are located on mouse 4D2.2–D3 and rat 5q36.13, both of which are regions with conserved linkage homology to human chromosome 1p. Animal model experiments lend further support to the function of EPHB2. Halford et al. (2000) generated mice deficient in Ryk (OMIM Ref. No. 600524) and found that they had a distinctive craniofacial appearance, shortened limbs, and postnatal mortality due to feeding and respiratory complications associated with a complete cleft of the secondary palate. Consistent with cleft palate phenocopy in Ephb2/Ephb3 (OMIM Ref. No. 601839)–deficient mice and the role of a Drosophila Ryk ortholog, 'Derailed,' in the transduction of repulsive axon pathfinding cues, biochemical data implicated Ryk in signaling mediated by Eph receptors and cell junction–associated Af6 (OMIM Ref. No. 159559). Halford et al. (2000) concluded that their findings highlighted the importance of signal crosstalk between members of different RTK subfamilies.

[23579] It is appreciated that the abovementioned animal model for EPHB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre–

ciated from the publications sited hereinbelow.

[23580] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23581] Ikegaki, N.; Tang, X. X.; Liu, X.-G.; Biegel, J. A.; Allen, C.; Yoshioka, A.; Sulman, E. P.; Brodeur, G. M.; Pleasure, D. E. : Molecular characterization and chromosomal localization of DRT (EPHT3): a developmentally regulated human protein-tyrosine kinase gene of the EPH family. Hum. Molec. Genet. 4: 2033-2045, 1995. ; and

[23582] Halford, M. M.; Armes, J.; Buchert, M.; Meskenaite, V.; Grail, D.; Hibbs, M. L.; Wilks, A. F.; Farlie, P. G.; Newgreen, D. F.; Hovens, C. M.; Stacker, S. A. : Ryk-deficient mice exhibit.

[23583] Further studies establishing the function and utilities of EPHB2 are found in John Hopkins OMIM database record ID 600997, and in sited publications numbered 12700, 12675-7763, 7565, 7764, 7877, 7878-7879, 776 and 7880 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Exonuclease 1 (EXO1, Accession NM\_130398) is another VGAM533 host target gene. EXO1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by EXO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXO1 BINDING SITE, designated SEQ ID:28182, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23584] Another function of VGAM533 is therefore inhibition of Exonuclease 1 (EXO1, Accession NM\_130398), a gene which excise and replace mismatched segments. Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXO1. The function of EXO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM399.CNIL (Accession NM\_005776) is another VGAM533 host target gene. CNIL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNIL BINDING SITE, designated SEQ ID:12354, to the nucleotide se-

quence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23585] Another function of VGAM533 is therefore inhibition of CNIL (Accession NM\_005776). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNIL. Dickkopf Homolog 2 (*Xenopus laevis*) (DKK2, Accession NM\_014421) is another VGAM533 host target gene. DKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK2 BINDING SITE, designated SEQ ID:15775, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23586] Another function of VGAM533 is therefore inhibition of Dickkopf Homolog 2 (*Xenopus laevis*) (DKK2, Accession NM\_014421). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK2. FLJ10307 (Accession NM\_018053) is another VGAM533 host target gene. FLJ10307 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by FLJ10307, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10307 BINDING SITE, designated SEQ ID:19812, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23587] Another function of VGAM533 is therefore inhibition of FLJ10307 (Accession NM\_018053). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10307. General Transcription Factor IIIC, Polypeptide 1, Alpha 220kDa (GTF3C1, Accession NM\_001520) is another VGAM533 host target gene. GTF3C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF3C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF3C1 BINDING SITE, designated SEQ ID:7261, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23588] Another function of VGAM533 is therefore inhibition of General Transcription Factor IIIC, Polypeptide 1, Alpha 220kDa (GTF3C1, Accession NM\_001520). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF3C1. HSA277841 (Accession NM\_018553) is another VGAM533 host target gene. HSA277841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA277841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA277841 BINDING SITE, designated SEQ ID:20634, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23589] Another function of VGAM533 is therefore inhibition of HSA277841 (Accession NM\_018553). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA277841. KIAA0189 (Accession NM\_014725) is another VGAM533 host target gene. KIAA0189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0189, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0189 BINDING SITE, designated SEQ ID:16318, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23590] Another function of VGAM533 is therefore inhibition of KIAA0189 (Accession NM\_014725). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0189. KIAA0552 (Accession NM\_014731) is another VGAM533 host target gene. KIAA0552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0552 BINDING SITE, designated SEQ ID:16347, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23591] Another function of VGAM533 is therefore inhibition of KIAA0552 (Accession NM\_014731). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0552. KIAA0712 (Accession NM\_014715) is another VGAM533 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:16265, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23592] Another function of VGAM533 is therefore inhibition of KIAA0712 (Accession NM\_014715). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0712. WWP1 (Accession XM\_087357) is another VGAM533 host target gene. WWP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWP1 BINDING SITE, designated SEQ ID:39191, to the nucleotide sequence of

VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23593] Another function of VGAM533 is therefore inhibition of WWP1 (Accession XM\_087357). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWP1. LOC137492 (Accession XM\_059910) is another VGAM533 host target gene. LOC137492 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC137492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137492 BINDING SITE, designated SEQ ID:37106, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23594] Another function of VGAM533 is therefore inhibition of LOC137492 (Accession XM\_059910). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137492. LOC144776 (Accession XM\_084964) is another VGAM533 host target gene. LOC144776 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC144776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144776 BINDING SITE, designated SEQ ID:37787, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23595] Another function of VGAM533 is therefore inhibition of LOC144776 (Accession XM\_084964). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144776. LOC146420 (Accession XM\_096996) is another VGAM533 host target gene. LOC146420 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146420 BINDING SITE, designated SEQ ID:40694, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23596] Another function of VGAM533 is therefore inhibition of LOC146420 (Accession XM\_096996). Accordingly, utilities

of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146420. LOC158402 (Accession XM\_098936) is another VGAM533 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41978, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23597] Another function of VGAM533 is therefore inhibition of LOC158402 (Accession XM\_098936). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. LOC257438 (Accession XM\_168338) is another VGAM533 host target gene. LOC257438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257438 BINDING SITE, designated SEQ ID:45106, to the nucleotide sequence of VGAM533 RNA, herein designated VGAM RNA, also designated SEQ ID:3244.

[23598] Another function of VGAM533 is therefore inhibition of LOC257438 (Accession XM\_168338). Accordingly, utilities of VGAM533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257438. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 534 (VGAM534) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23599] VGAM534 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM534 was detected is described hereinabove with reference to Figs. 1–8.

[23600] VGAM534 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Orgyia Pseudotsugata Single Capsid Nuclear Polyhedrosis Virus. VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23601] VGAM534 gene encodes a VGAM534 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM534 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM534 precursor RNA is designated SEQ ID:520, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:520 is located at position 23857 relative to the genome of Orgyia Pseudotsugata Single Capsid Nuclear Polyhedrosis Virus.

[23602] VGAM534 precursor RNA folds onto itself, forming VGAM534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23603] An enzyme complex designated DICER COMPLEX, `dices` the VGAM534 folded precursor RNA into VGAM534 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM534 RNA is designated SEQ ID:3245, and is provided hereinbelow with reference to the sequence listing part.

[23604] VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM534 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23605] VGAM534 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM534 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM534 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23606] The complementary binding of VGAM534 RNA, herein designated VGAM RNA, to host target binding sites on VGAM534 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM534 host target RNA into VGAM534 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23607] It is appreciated that VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM534 host target genes. The mRNA of each one of this plurality of VGAM534 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM534 RNA, herein designated VGAM RNA, and which when bound by VGAM534 RNA causes inhibition of translation of respective one or more VGAM534 host target proteins.

[23608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM534 gene, herein designated VGAM GENE, on one or more VGAM534 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23609] It is yet further appreciated that a function of VGAM534 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of viral infection by Orgyia Pseudotsugata Single Capsid Nuclear Polyhedrosis Virus. Specific functions, and accordingly utilities, of VGAM534 correlate with, and may be deduced from, the identity of the host target genes which VGAM534 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23610] Nucleotide sequences of the VGAM534 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM534 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM534 are further described hereinbelow with reference to Table 1.

[23611] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM534 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM534 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23612] As mentioned hereinabove with reference to Fig. 1, a function of VGAM534 gene, herein designated VGAM is inhibition of expression of VGAM534 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM534 correlate with, and may be deduced from, the identity of the target genes which VGAM534 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23613] Forkhead Box D2 (FOXD2, Accession NM\_004474) is a VGAM534 host target gene. FOXD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD2 BINDING SITE, designated SEQ ID:10790, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3245.

[23614] A function of VGAM534 is therefore inhibition of Forkhead Box D2 (FOXD2, Accession NM\_004474). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD2. Syndecan 1 (SDC1, Accession NM\_002997) is another VGAM534 host target gene. SDC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC1 BINDING SITE, designated SEQ ID:8887, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23615] Another function of VGAM534 is therefore inhibition of Syndecan 1 (SDC1, Accession NM\_002997), a gene which mediates cell behaviors like cell adhesion, action of growth factors. Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC1. The function of SDC1 has been established by previous studies. Sanderson et al. (1989) showed that Sdc1 is expressed in mouse only when

and where B lymphocytes associate with extracellular matrix, namely as B-cell precursors in bone marrow and as immobilized plasma cells in interstitial matrices. Expression is lost immediately before maturation and release of B lymphocytes into the circulation and is absent on circulating and mature peripheral B lymphocytes. SDC1 is re-expressed on differentiated plasma cells and is a marker for cells secreting immunoglobulin. By probing a breast epithelial cell line cDNA library with mouse syndecan probes, Mali et al. (1990) obtained a cDNA encoding human SDC1. Sequence analysis predicted that the 310-amino acid human protein is 77% identical to the mouse sequence. SDC1 has an ectodomain, a 25-residue transmembrane domain, and a 34-residue cytoplasmic domain, which are 70%, 96%, and 100% identical to those of the mouse protein, respectively. The ectodomain is preceded by an N-terminal signal peptide and contains 5 potential glycosaminoglycan-attachment sites, 1 potential N-glycosylation site, and a dibasic lys-arg cleavage site adjacent to the transmembrane domain. Northern blot analysis revealed expression of 2.6- and 3.4-kb SDC1 transcripts in mammary epithelial and carcinoma cells and in fetal skin; a 4.5-kb transcript was detected in brain.

Animal model experiments lend further support to the function of SDC1. Reizes et al. (2001) found that transgenic expression in the hypothalamus of Sdc1 produced mice with hyperphagia and maturity-onset obesity resembling mice with reduced action of alpha-melanocyte-stimulating hormone (alpha-MSH; OMIM Ref. No. 155555). Via their heparan sulfate chains, syndecans potentiate the action of agouti-related protein (OMIM Ref. No. 602311) and agouti signaling protein (OMIM Ref. No. 600201), endogenous inhibitors of alpha-MSH. In wild-type mice, Sdc3 (OMIM Ref. No. 186357), the predominantly neural syndecan, was expressed in hypothalamic regions that control energy balance. Food deprivation increased hypothalamic Sdc3 levels several-fold. Sdc3 null mice, which otherwise appeared normal, responded to food deprivation with markedly reduced reflex hyperphagia. Reizes et al. (2001) proposed that oscillation of hypothalamic SDC3 levels physiologically modulates feeding behavior.

[23616] It is appreciated that the abovementioned animal model for SDC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[23617] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23618] Alexander, C. M.; Reichsman, F.; Hinkes, M. T.; Lincecum, J.; Becker, K. A.; Cumberledge, S.; Bernfield, M. : Syndecan-1 is required for Wnt-1-induced mammary tumorigenesis in mice. *Nature Genet.* 25: 329-332, 2000. ; and

[23619] Mali, M.; Jaakkola, P.; Arvilommi, A.-M.; Jalkanen, M. : Sequence of human syndecan indicates a novel gene family of integral membrane proteoglycans. *J. Biol. Chem.* 265: 6884-6889, 199.

[23620] Further studies establishing the function and utilities of SDC1 are found in John Hopkins OMIM database record ID 186355, and in cited publications numbered 10500-1050 and 11616 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CSR1 (Accession NM\_016240) is another VGAM534 host target gene. CSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSR1 BINDING SITE, designated SEQ ID:18360,

to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23621] Another function of VGAM534 is therefore inhibition of CSR1 (Accession NM\_016240). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSR1. DKFZP434P211 (Accession NM\_014549) is another VGAM534 host target gene. DKFZP434P211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:15869, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23622] Another function of VGAM534 is therefore inhibition of DKFZP434P211 (Accession NM\_014549). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211. DKFZP586B2420 (Accession XM\_059482) is another VGAM534 host target gene. DKFZP586B2420 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by DKFZP586B2420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586B2420 BINDING SITE, designated SEQ ID:37009, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23623] Another function of VGAM534 is therefore inhibition of DKFZP586B2420 (Accession XM\_059482). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586B2420. FBX30 (Accession NM\_033182) is another VGAM534 host target gene. FBX30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBX30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBX30 BINDING SITE, designated SEQ ID:27042, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23624] Another function of VGAM534 is therefore inhibition of

FBX30 (Accession NM\_033182). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBX30. HSPC043 (Accession XM\_041943) is another VGAM534 host target gene. HSPC043 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC043 BINDING SITE, designated SEQ ID:33636, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23625] Another function of VGAM534 is therefore inhibition of HSPC043 (Accession XM\_041943). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC043. KIAA0495 (Accession XM\_031397) is another VGAM534 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31356, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23626] Another function of VGAM534 is therefore inhibition of KIAA0495 (Accession XM\_031397). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA1243 (Accession XM\_057057) is another VGAM534 host target gene. KIAA1243 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1243 BINDING SITE, designated SEQ ID:36471, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23627] Another function of VGAM534 is therefore inhibition of KIAA1243 (Accession XM\_057057). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1243. LOC157918 (Accession XM\_098842) is another

VGAM534 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41898, to the nucleotide sequence of VGAM534 RNA, herein designated VGAM RNA, also designated SEQ ID:3245.

[23628] Another function of VGAM534 is therefore inhibition of LOC157918 (Accession XM\_098842). Accordingly, utilities of VGAM534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 535 (VGAM535) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23629] VGAM535 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM535 was detected is described

hereinabove with reference to Figs. 1–8.

[23630] VGAM535 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hendra Virus. VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23631] VGAM535 gene encodes a VGAM535 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM535 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM535 precursor RNA is designated SEQ ID:521, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:521 is located at position 9666 relative to the genome of Hendra Virus.

[23632] VGAM535 precursor RNA folds onto itself, forming VGAM535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nu–

cleotide sequence of the second half thereof.

[23633] An enzyme complex designated DICER COMPLEX, `dices` the VGAM535 folded precursor RNA into VGAM535 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM535 RNA is designated SEQ ID:3246, and is provided hereinbelow with reference to the sequence listing part.

[23634] VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM535 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23635] VGAM535 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM535 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM535 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM535 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23636] The complementary binding of VGAM535 RNA, herein designated VGAM RNA, to host target binding sites on VGAM535 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM535 host target RNA into VGAM535 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23637] It is appreciated that VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM535 host target genes. The mRNA of each one of this plurality of VGAM535 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM535 RNA, herein designated VGAM RNA, and which when bound by VGAM535 RNA causes inhibition of translation of respective one or more VGAM535 host target proteins.

[23638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM535 gene, herein designated VGAM GENE, on one or more VGAM535 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23639] It is yet further appreciated that a function of VGAM535 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of viral infection by Hendra Virus. Specific functions, and accordingly utilities, of VGAM535 correlate with, and may be deduced from, the identity of the host target genes which VGAM535 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23640] Nucleotide sequences of the VGAM535 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM535 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM535 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM535 are further described hereinbelow with reference to Table 1.

[23641] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM535 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM535 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23642] As mentioned hereinabove with reference to Fig. 1, a function of VGAM535 gene, herein designated VGAM is inhibition of expression of VGAM535 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM535 correlate with, and may be deduced from, the identity of the target genes which VGAM535 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23643] Pleckstrin Homology-like Domain, Family A, Member 3 (PHLDA3, Accession NM\_012396) is a VGAM535 host target gene. PHLDA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHLDA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PHLDA3 BINDING SITE, designated SEQ ID:14760, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23644] A function of VGAM535 is therefore inhibition of Pleckstrin Homology-like Domain, Family A, Member 3 (PHLDA3, Accession NM\_012396). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHLDA3. Pim-2 Oncogene (PIM2, Accession XM\_010208) is another VGAM535 host target gene. PIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM2 BINDING SITE, designated SEQ ID:30135, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23645] Another function of VGAM535 is therefore inhibition of Pim-2 Oncogene (PIM2, Accession XM\_010208). Accordingly, utilities of VGAM535 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with PIM2. DKFZP566G1424 (Accession XM\_097771) is another VGAM535 host target gene. DKFZP566G1424 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566G1424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566G1424 BINDING SITE, designated SEQ ID:41116, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23646] Another function of VGAM535 is therefore inhibition of DKFZP566G1424 (Accession XM\_097771). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566G1424. FLJ11370 (Accession NM\_024961) is another VGAM535 host target gene. FLJ11370 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ11370 BINDING SITE, designated SEQ ID:24517, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23647] Another function of VGAM535 is therefore inhibition of FLJ11370 (Accession NM\_024961). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11370. MIG (Accession NM\_002416) is another VGAM535 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8247, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23648] Another function of VGAM535 is therefore inhibition of MIG (Accession NM\_002416). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. Phosphatase, Orphan 1 (phospho1, Accession XM\_091572) is another VGAM535 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in

the 5` untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phospho1 BINDING SITE, designated SEQ ID:40059, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23649] Another function of VGAM535 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM\_091572). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. Zinc Finger Protein 262 (ZNF262, Accession NM\_005095) is another VGAM535 host target gene. ZNF262 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF262 BINDING SITE, designated SEQ ID:11559, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23650] Another function of VGAM535 is therefore inhibition of Zinc Finger Protein 262 (ZNF262, Accession NM\_005095). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF262. LOC144308 (Accession XM\_096575) is another VGAM535 host target gene. LOC144308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:40405, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23651] Another function of VGAM535 is therefore inhibition of LOC144308 (Accession XM\_096575). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144308. LOC149414 (Accession XM\_097635) is another VGAM535 host target gene. LOC149414 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149414, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149414 BINDING SITE, designated SEQ ID:40988, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23652] Another function of VGAM535 is therefore inhibition of LOC149414 (Accession XM\_097635). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149414. LOC196527 (Accession XM\_113743) is another VGAM535 host target gene. LOC196527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196527 BINDING SITE, designated SEQ ID:42401, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23653] Another function of VGAM535 is therefore inhibition of LOC196527 (Accession XM\_113743). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC196527. LOC199858 (Accession XM\_114040) is another VGAM535 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42629, to the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23654] Another function of VGAM535 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC222134 (Accession XM\_168432) is another VGAM535 host target gene. LOC222134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222134 BINDING SITE, designated SEQ ID:45169, to

the nucleotide sequence of VGAM535 RNA, herein designated VGAM RNA, also designated SEQ ID:3246.

[23655] Another function of VGAM535 is therefore inhibition of LOC222134 (Accession XM\_168432). Accordingly, utilities of VGAM535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222134. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 536 (VGAM536) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23656] VGAM536 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM536 was detected is described hereinabove with reference to Figs. 1–8.

[23657] VGAM536 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM536 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23658] VGAM536 gene encodes a VGAM536 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM536 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM536 precursor RNA is designated SEQ ID:522, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:522 is located at position 103974 relative to the genome of Ate-line Herpesvirus 3.

[23659] VGAM536 precursor RNA folds onto itself, forming VGAM536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23660] An enzyme complex designated DICER COMPLEX, `dices` the VGAM536 folded precursor RNA into VGAM536 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM536 RNA is designated SEQ ID:3247, and is provided hereinbelow with reference to the sequence listing part.

[23661] VGAM536 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM536 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[23662] VGAM536 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM536 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM536 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23663] The complementary binding of VGAM536 RNA, herein designated VGAM RNA, to host target binding sites on VGAM536 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM536 host target RNA into VGAM536 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23664] It is appreciated that VGAM536 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM536 host target genes. The mRNA of each one of this plurality of VGAM536 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM536 RNA, herein designated VGAM RNA, and which when bound by VGAM536 RNA causes inhibition of translation of respective one or more VGAM536 host target proteins.

[23665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM536 gene, herein designated VGAM GENE, on one or more VGAM536 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[23666] It is yet further appreciated that a function of VGAM536 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM536 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM536 correlate with, and may be deduced from, the identity of the host target genes which VGAM536 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23667] Nucleotide sequences of the VGAM536 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM536 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM536 are further described hereinbelow with reference to Table 1.

[23668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM536 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM536 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23669] As mentioned hereinabove with reference to Fig. 1, a function of VGAM536 gene, herein designated VGAM is inhibition of expression of VGAM536 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM536 correlate with, and may be deduced from, the identity of the target genes which VGAM536 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23670] V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163) is a VGAM536 host target gene. AKT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT1 BINDING SITE, designated SEQ ID:11649, to the nucleotide sequence of VGAM536 RNA, herein designated VGAM RNA, also designated SEQ ID:3247.

[23671] A function of VGAM536 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Ac-

cession NM\_005163), a gene which Serine–threonine protein kinase. Accordingly, utilities of VGAM536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT1. The function of AKT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM188.KIAA0534 (Accession XM\_049349) is another VGAM536 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35376, to the nucleotide sequence of VGAM536 RNA, herein designated VGAM RNA, also designated SEQ ID:3247.

[23672] Another function of VGAM536 is therefore inhibition of KIAA0534 (Accession XM\_049349). Accordingly, utilities of VGAM536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 537 (VGAM537) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23673] VGAM537 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM537 was detected is described hereinabove with reference to Figs. 1–8.

[23674] VGAM537 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23675] VGAM537 gene encodes a VGAM537 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM537 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM537 precursor RNA is designated SEQ ID:523, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:523 is located at position 103754 relative to the genome of Ate–

line Herpesvirus 3.

[23676] VGAM537 precursor RNA folds onto itself, forming VGAM537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23677] An enzyme complex designated DICER COMPLEX, `dices` the VGAM537 folded precursor RNA into VGAM537 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM537 RNA is designated SEQ ID:3248, and is provided hereinbelow with reference to the sequence listing part.

[23678] VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM537 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23679] VGAM537 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM537 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM537 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23680] The complementary binding of VGAM537 RNA, herein designated VGAM RNA, to host target binding sites on VGAM537 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM537 host target RNA into VGAM537 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23681] It is appreciated that VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM537 host target genes. The mRNA of each one of this plurality of VGAM537 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM537 RNA, herein designated VGAM RNA, and which when bound by VGAM537 RNA causes inhibition of translation of respective one or more VGAM537 host target proteins.

[23682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM537 gene, herein designated VGAM GENE, on one or more VGAM537 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23683] It is yet further appreciated that a function of VGAM537 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM537 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM537 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM537 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23684] Nucleotide sequences of the VGAM537 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM537 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM537 are further described hereinbelow with reference to Table 1.

[23685] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM537 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM537 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23686] As mentioned hereinabove with reference to Fig. 1, a function of VGAM537 gene, herein designated VGAM is inhibition of expression of VGAM537 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM537 correlate with, and may be deduced

from, the identity of the target genes which VGAM537 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23687] G Protein-coupled Receptor 18 (GPR18, Accession NM\_005292) is a VGAM537 host target gene. GPR18 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR18 BINDING SITE, designated SEQ ID:11783, to the nucleotide sequence of VGAM537 RNA, herein designated VGAM RNA, also designated SEQ ID:3248.

[23688] A function of VGAM537 is therefore inhibition of G Protein-coupled Receptor 18 (GPR18, Accession NM\_005292). Accordingly, utilities of VGAM537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR18. LOC148894 (Accession XM\_097542) is another VGAM537 host target gene. LOC148894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148894 BINDING SITE, designated SEQ ID:40914, to the nucleotide sequence of VGAM537 RNA, herein designated VGAM RNA, also designated SEQ ID:3248.

[23689] Another function of VGAM537 is therefore inhibition of LOC148894 (Accession XM\_097542). Accordingly, utilities of VGAM537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 538 (VGAM538) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23690] VGAM538 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM538 was detected is described hereinabove with reference to Figs. 1–8.

[23691] VGAM538 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM538 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[23692] VGAM538 gene encodes a VGAM538 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM538 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM538 precursor RNA is designated SEQ ID:524, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:524 is located at position 65909 relative to the genome of Ate-line Herpesvirus 3.

[23693] VGAM538 precursor RNA folds onto itself, forming VGAM538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23694] An enzyme complex designated DICER COMPLEX, `dices` the VGAM538 folded precursor RNA into VGAM538 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM538 RNA is designated SEQ ID:3249, and is provided hereinbelow with reference to the sequence listing part.

[23695] VGAM538 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM538 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23696] VGAM538 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM538 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM538 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23697] The complementary binding of VGAM538 RNA, herein designated VGAM RNA, to host target binding sites on VGAM538 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM538 host target RNA into VGAM538 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[23698] It is appreciated that VGAM538 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM538 host target genes. The mRNA of each one of this plurality of VGAM538 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM538 RNA, herein designated VGAM RNA, and which when bound by VGAM538 RNA causes inhibition of translation of respective one or more VGAM538 host target proteins.

[23699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM538 gene, herein designated VGAM GENE, on one or more VGAM538 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23700] It is yet further appreciated that a function of VGAM538 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM538 correlate with, and may be deduced from, the identity of the host target genes which VGAM538 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23701] Nucleotide sequences of the VGAM538 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM538 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM538 are further described hereinbelow with reference to Table 1.

[23702] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM538 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM538 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23703] As mentioned hereinabove with reference to Fig. 1, a function of VGAM538 gene, herein designated VGAM is inhibition of expression of VGAM538 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM538 correlate with, and may be deduced from, the identity of the target genes which VGAM538 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23704] Annexin A8 (ANXA8, Accession NM\_001630) is a VGAM538 host target gene. ANXA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANXA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANXA8 BINDING SITE, designated SEQ ID:7341, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3249.

[23705] A function of VGAM538 is therefore inhibition of Annexin A8 (ANXA8, Accession NM\_001630), a gene which acts as an indirect inhibitor of the thromboplastin-specific complex, which is involved in the blood coagulation cascade. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANXA8. The function of ANXA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM372. CERD4 (Accession NM\_012074) is another VGAM538 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14347, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23706] Another function of VGAM538 is therefore inhibition of CERD4 (Accession NM\_012074). Accordingly, utilities of

VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM\_031363) is another VGAM538 host target gene. COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3, designated SEQ ID:25355, SEQ ID:25361 and SEQ ID:5548 respectively, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23707] Another function of VGAM538 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM\_031363). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3. Dual Specificity Phosphatase 5 (DUSP5, Accession NM\_004419) is another VGAM538 host target gene. DUSP5 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by DUSP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP5 BINDING SITE, designated SEQ ID:10685, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23708] Another function of VGAM538 is therefore inhibition of Dual Specificity Phosphatase 5 (DUSP5, Accession NM\_004419), a gene which displays phosphatase activity toward several substrates. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP5. The function of DUSP5 has been established by previous studies. The VH1 phosphatase encoded by vaccinia virus is a dual-specificity protein-tyrosine phosphatase (OMIM Ref. No. PTPase) which hydrolyzes substrates phosphorylated on both tyrosine and serine/threonine residues. VH1-like PTPases have been identified in humans and other organisms. See DUSP1 (OMIM Ref. No. 600714). To identify additional human dual-specificity PTPases, Martell et al. (1994) screened a genomic library with a partial

DUSP1 cDNA. They isolated several novel PTPase genes, including 1 which they designated HVH3 for human VH1-like PTPase-3. Kwak and Dixon (1995) cloned human placental HVH3 cDNAs and reported that the predicted protein has 384 amino acids. Using immunofluorescence, they determined that epitope-tagged HVH3 is localized primarily in the nucleus of mammalian cells. Ishibashi et al. (1994) isolated HVH3 cDNAs from a human mammary epithelial cell cDNA library and found that the predicted protein has 397 amino acids. In vitro, recombinant protein containing the catalytic domain of HVH3 displayed phosphatase activity toward several substrates. The highest relative activity was toward ERK1 (OMIM Ref. No. 601795), suggesting that it may be a target for HVH3 activity in vivo. Northern blot analysis revealed that HVH3 is expressed as a 2.5-kb mRNA in a variety of tissues, with the highest levels in pancreas and brain. HVH3 expression was induced by serum stimulation of fibroblasts and by heat shock, with similar kinetics to those observed with DUSP1. As has been proposed for other dual-specificity PTPases like DUSP1 and DUSP2 (OMIM Ref. No. 603068), Ishibashi et al. (1994) suggested that the induction of HVH3 may lead to the deactivation of mitogen- or stress-

activated protein kinases, thereby restoring these signaling pathways to their mitogen- or stress-sensitive state. By fluorescence in situ hybridization, Martell et al. (1994) mapped the HVH3 gene to 10q25

[23709] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23710] Ishibashi, T.; Bottaro, D. P.; Michieli, P.; Kelley, C. A.; Aaronson, S. A. : A novel dual specificity phosphatase induced by serum stimulation and heat shock. J. Biol. Chem. 269: 29897–29902, 1994. ; and

[23711] Martell, K. J.; Kwak, S.; Hakes, D. J.; Dixon, J. E.; Trent, J. M. : Chromosomal localization of four human VH1-like protein-tyrosine phosphatases. Genomics 22: 462–464, 1994.

[23712] Further studies establishing the function and utilities of DUSP5 are found in John Hopkins OMIM database record ID 603069, and in cited publications numbered 8850–885 and 10055 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Eukaryotic Translation Initiation Factor 1A, Y Chromosome (EIF1AY, Accession NM\_004681) is another VGAM538 host target gene. EIF1AY BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1AY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1AY BINDING SITE, designated SEQ ID:11045, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23713] Another function of VGAM538 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A, Y Chromosome (EIF1AY, Accession NM\_004681). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1AY. Echinoderm Microtubule Associated Protein Like 1 (EML1, Accession XM\_007243) is another VGAM538 host target gene. EML1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML1 BINDING SITE, designated SEQ ID:30037, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23714] Another function of VGAM538 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 1 (EML1, Accession XM\_007243). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML1. Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_000604) is another VGAM538 host target gene. FGFR1 BINDING SITE1 through FGFR1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE3, designated SEQ ID:6209, SEQ ID:23374 and SEQ ID:17980 respectively, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23715] Another function of VGAM538 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_000604). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with FGFR1. Histone Deacetylase 4 (HDAC4, Accession NM\_006037) is another VGAM538 host target gene. HDAC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12667, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23716] Another function of VGAM538 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM\_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and may mediate transcriptional regulation. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Itchy Homolog E3 Ubiquitin Protein Ligase (mouse) (ITCH, Accession NM\_031483) is another

VGAM538 host target gene. ITCH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITCH BINDING SITE, designated SEQ ID:25563, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23717] Another function of VGAM538 is therefore inhibition of Itchy Homolog E3 Ubiquitin Protein Ligase (mouse) (ITCH, Accession NM\_031483), a gene which accepts ubiquitin from an e2 ubiquitin-conjugating enzyme in the form of a thioester and then directly transfers the ubiquitin to targeted substrates. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITCH. The function of ITCH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Lipase A, Lysosomal Acid, Cholesterol Esterase (Wolman disease) (LIPA, Accession NM\_000235) is another VGAM538 host target gene. LIPA BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by LIPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPA BINDING SITE, designated SEQ ID:5746, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23718] Another function of VGAM538 is therefore inhibition of Lipase A, Lysosomal Acid, Cholesterol Esterase (Wolman disease) (LIPA, Accession NM\_000235). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPA. Neuroblastoma RAS Viral (v-ras) Oncogene Homolog (NRAS, Accession NM\_002524) is another VGAM538 host target gene. NRAS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRAS BINDING SITE, designated SEQ ID:8362, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23719] Another function of VGAM538 is therefore inhibition of Neuroblastoma RAS Viral (v-ras) Oncogene Homolog (NRAS, Accession NM\_002524), a gene which ras proteins bind gdp/gtp and possess intrinsic gtpase activity. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRAS. The function of NRAS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM351. Oxidative-stress Responsive 1 (OSR1, Accession NM\_005109) is another VGAM538 host target gene. OSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSR1 BINDING SITE, designated SEQ ID:11591, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23720] Another function of VGAM538 is therefore inhibition of Oxidative-stress Responsive 1 (OSR1, Accession NM\_005109), a gene which mediates stress-activated sig-

nals. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSR1. The function of OSR1 has been established by previous studies. The 3p22–p21.3 chromosomal region is one of 3 regions of 3p that is commonly deleted in various carcinomas. By analyzing a cloned segment from this region, Tamari et al. (1999) identified a novel gene that they designated OSR1 (oxidative stress–responsive–1) because the predicted 527–amino acid protein shares 39% identity with Ste20/oxidant stress–response kinase–1 (OMIM Ref. No. 602255). The OSR1 gene contains 18 exons and spans approximately 90 kb. Northern blot analysis revealed that OSR1 was expressed as a 4.6–kb major transcript in all tissues tested. A less abundant 7.5–kb mRNA was detected in heart and skeletal muscle. Daigo et al. (1999) reported that the OSR1 gene is located between the OCTL1 (OMIM Ref. No. 604047) and MYD88 (OMIM Ref. No. 602170) genes on 3p22–p21.3.

[23721] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23722] Tamari, M.; Daigo, Y.; Nakamura, Y. : Isolation and char–

acterization of a novel serine threonine kinase gene on chromosome 3q22–21.3. J. Hum. Genet. 44: 116–120, 1999. ; and

[23723] Daigo, Y.; Isomura, M.; Nishiwaki, T.; Tamari, M.; Ishikawa, S.; Kai, M.; Murata, Y.; Takeuchi, K.; Yamane, Y.; Hayashi, R.; Minami, M.; Fujino, M. A.; Hojo, Y.; Uchiyama, I.; Takagi, T.;

[23724] Further studies establishing the function and utilities of OSR1 are found in John Hopkins OMIM database record ID 604046, and in cited publications numbered 9037 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Plexin A2 (PLXNA2, Accession NM\_025179) is another VGAM538 host target gene. PLXNA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLXNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNA2 BINDING SITE, designated SEQ ID:24814, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23725] Another function of VGAM538 is therefore inhibition of

Plexin A2 (PLXNA2, Accession NM\_025179), a gene which is a transmembrane protein. Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNA2. The function of PLXNA2 has been established by previous studies. In the course of searching for previously unknown genes on the human X chromosome, Maestrini et al. (1996) identified a cDNA in Xq28 encoding a transmembrane protein that they termed SEX (OMIM Ref. No. 300022). They showed that SEX shares significant homology with the extracellular domain of the receptors encoded by MET and other members of the hepatocyte growth factor (HGF) receptor family. Three other sequences closely related to SEX were identified, 1 of which (designated OCT) was shown by analysis of a panel of human/hamster somatic cell hybrids to map to chromosome 1. The proteins encoded by all 4 genes contained large cytoplasmic domains characterized by a distinctive highly conserved sequence they called the SEX domain. See also 601053 and 601055. Nomenclature: Tamagnone et al. (1999) proposed a novel nomenclature for the genes of the plexin family, which they grouped into the A, B, C, and D subfamilies; the PLXN2 gene was renamed plexin A2 by

them.

[23726] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23727] Maestrini, E.; Tamagnone, L.; Longati, P.; Cremona, O.; Gulisano, M.; Bione, S.; Tamanini, F.; Neel, B. G.; Toniolo, D.; Comoglio, P. M. : A family of transmembrane proteins with homology to the MET–hepatocyte growth factor receptor. *Proc. Nat. Acad. Sci.* 93: 674–678, 1996. ; and

[23728] Tamagnone, L.; Artigiani, S.; Chen, H.; He, Z.; Ming, G.; Song, H.; Chedotal, A.; Winberg, M. L.; Goodman, C. S.; Poo, M.; Tessier–Lavigne, M.; Comoglio, P. M. : Plexins are a large family.

[23729] Further studies establishing the function and utilities of PLXNA2 are found in John Hopkins OMIM database record ID 601054, and in cited publications numbered 7271–7272 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM\_003060) is another VGAM538 host target gene. SLC22A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC22A5, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A5 BINDING SITE, designated SEQ ID:9027, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23730] Another function of VGAM538 is therefore inhibition of Solute Carrier Family 22 (organic cation transporter), Member 5 (SLC22A5, Accession NM\_003060). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A5. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM\_003242) is another VGAM538 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:9240, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23731] Another function of VGAM538 is therefore inhibition of

Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM\_003242). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB2. Titin (TTN, Accession NM\_133378) is another VGAM538 host target gene. TTN BINDING SITE1 through TTN BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TTN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTN BINDING SITE1 through TTN BINDING SITE4, designated SEQ ID:28503, SEQ ID:28505, SEQ ID:28508 and SEQ ID:28518 respectively, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23732] Another function of VGAM538 is therefore inhibition of Titin (TTN, Accession NM\_133378). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTN. Cysteine and Histidine-rich Domain (CHORD)-containing, Zinc Binding Protein 1 (CHORDC1, Accession NM\_012124) is another VGAM538 host target gene. CHORDC1 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHORDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHORDC1 BINDING SITE, designated SEQ ID:14437, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23733] Another function of VGAM538 is therefore inhibition of Cysteine and Histidine-rich Domain (CHORD)-containing, Zinc Binding Protein 1 (CHORDC1, Accession NM\_012124). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHORDC1. DKFZP434C0826 (Accession XM\_097248) is another VGAM538 host target gene. DKFZP434C0826 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434C0826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C0826 BINDING SITE, designated SEQ ID:40845, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3249.

[23734] Another function of VGAM538 is therefore inhibition of DKFZP434C0826 (Accession XM\_097248). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C0826. DKFZp566H0824 (Accession NM\_017535) is another VGAM538 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18977, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23735] Another function of VGAM538 is therefore inhibition of DKFZp566H0824 (Accession NM\_017535). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. DnaJ (Hsp40) Homolog, Subfamily B, Member 4 (DNAJB4, Accession NM\_007034) is another VGAM538 host target gene. DNAJB4 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by DNAJB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJB4 BINDING SITE, designated SEQ ID:13904, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23736] Another function of VGAM538 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily B, Member 4 (DNAJB4, Accession NM\_007034). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB4. FLJ00026 (Accession XM\_036307) is another VGAM538 host target gene. FLJ00026 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00026 BINDING SITE, designated SEQ ID:32428, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23737] Another function of VGAM538 is therefore inhibition of FLJ00026 (Accession XM\_036307). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00026. FLJ10081 (Accession NM\_017991) is another VGAM538 host target gene. FLJ10081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10081 BINDING SITE, designated SEQ ID:19724, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23738] Another function of VGAM538 is therefore inhibition of FLJ10081 (Accession NM\_017991). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10081. FLJ10702 (Accession NM\_018184) is another VGAM538 host target gene. FLJ10702 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10702 BINDING SITE, designated SEQ ID:20027, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23739] Another function of VGAM538 is therefore inhibition of FLJ10702 (Accession NM\_018184). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10702. FLJ11850 (Accession NM\_022741) is another VGAM538 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:22950, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23740] Another function of VGAM538 is therefore inhibition of FLJ11850 (Accession NM\_022741). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11850.

FLJ13187 (Accession NM\_024613) is another VGAM538 host target gene. FLJ13187 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13187 BINDING SITE, designated SEQ ID:23870, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23741] Another function of VGAM538 is therefore inhibition of FLJ13187 (Accession NM\_024613). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13187. FLJ20232 (Accession NM\_019008) is another VGAM538 host target gene. FLJ20232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:21083, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3249.

[23742] Another function of VGAM538 is therefore inhibition of FLJ20232 (Accession NM\_019008). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232. KIAA0229 (Accession XM\_166478) is another VGAM538 host target gene. KIAA0229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0229 BINDING SITE, designated SEQ ID:44399, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23743] Another function of VGAM538 is therefore inhibition of KIAA0229 (Accession XM\_166478). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0229. KIAA0258 (Accession NM\_014785) is another VGAM538 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16652, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23744] Another function of VGAM538 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0276 (Accession XM\_048199) is another VGAM538 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:35137, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23745] Another function of VGAM538 is therefore inhibition of KIAA0276 (Accession XM\_048199). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0276. KIAA0322 (Accession XM\_166591) is another VGAM538 host target gene. KIAA0322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0322 BINDING SITE, designated SEQ ID:44560, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23746] Another function of VGAM538 is therefore inhibition of KIAA0322 (Accession XM\_166591). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0322. KIAA0515 (Accession XM\_033380) is another VGAM538 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31924, to the

nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23747] Another function of VGAM538 is therefore inhibition of KIAA0515 (Accession XM\_033380). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA0660 (Accession NM\_012297) is another VGAM538 host target gene. KIAA0660 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0660 BINDING SITE, designated SEQ ID:14657, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23748] Another function of VGAM538 is therefore inhibition of KIAA0660 (Accession NM\_012297). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0660. KIAA0876 (Accession XM\_035625) is another VGAM538 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32298, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23749] Another function of VGAM538 is therefore inhibition of KIAA0876 (Accession XM\_035625). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. KIAA0993 (Accession XM\_034413) is another VGAM538 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32081, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23750] Another function of VGAM538 is therefore inhibition of KIAA0993 (Accession XM\_034413). Accordingly, utilities

of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1023 (Accession NM\_017604) is another VGAM538 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19092, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23751] Another function of VGAM538 is therefore inhibition of KIAA1023 (Accession NM\_017604). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1265 (Accession XM\_047707) is another VGAM538 host target gene. KIAA1265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1265 BINDING SITE, designated SEQ ID:35036, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23752] Another function of VGAM538 is therefore inhibition of KIAA1265 (Accession XM\_047707). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1265. KIAA1493 (Accession XM\_034415) is another VGAM538 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32091, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23753] Another function of VGAM538 is therefore inhibition of KIAA1493 (Accession XM\_034415). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. KIAA1804 (Accession XM\_045864) is another VGAM538 host target gene. KIAA1804 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1804 BINDING SITE, designated SEQ ID:34587, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23754] Another function of VGAM538 is therefore inhibition of KIAA1804 (Accession XM\_045864). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1804. MGC2452 (Accession NM\_032644) is another VGAM538 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26372, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23755] Another function of VGAM538 is therefore inhibition of

MGC2452 (Accession NM\_032644). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. MGC2477 (Accession NM\_024099) is another VGAM538 host target gene. MGC2477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2477 BINDING SITE, designated SEQ ID:23542, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23756] Another function of VGAM538 is therefore inhibition of MGC2477 (Accession NM\_024099). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2477. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230) is another VGAM538 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30141, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23757] Another function of VGAM538 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM\_003003) is another VGAM538 host target gene. SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1 BINDING SITE, designated SEQ ID:8902, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23758] Another function of VGAM538 is therefore inhibition of SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession

NM\_003003). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L1. Sp2 Transcription Factor (SP2, Accession NM\_003110) is another VGAM538 host target gene. SP2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP2 BINDING SITE, designated SEQ ID:9081, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23759] Another function of VGAM538 is therefore inhibition of Sp2 Transcription Factor (SP2, Accession NM\_003110). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP2. SFRS Protein Kinase 1 (SRPK1, Accession NM\_003137) is another VGAM538 host target gene. SRPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of SRPK1 BINDING SITE, designated SEQ ID:9110, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23760] Another function of VGAM538 is therefore inhibition of SFRS Protein Kinase 1 (SRPK1, Accession NM\_003137). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRPK1. LOC134266 (Accession XM\_059701) is another VGAM538 host target gene. LOC134266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134266 BINDING SITE, designated SEQ ID:37072, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23761] Another function of VGAM538 is therefore inhibition of LOC134266 (Accession XM\_059701). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134266. LOC142972 (Accession XM\_036593) is an-

other VGAM538 host target gene. LOC142972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142972 BINDING SITE, designated SEQ ID:32478, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23762] Another function of VGAM538 is therefore inhibition of LOC142972 (Accession XM\_036593). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142972. LOC145439 (Accession XM\_085144) is another VGAM538 host target gene. LOC145439 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145439 BINDING SITE, designated SEQ ID:37864, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23763] Another function of VGAM538 is therefore inhibition of LOC145439 (Accession XM\_085144). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145439. LOC147165 (Accession XM\_097205) is another VGAM538 host target gene. LOC147165 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147165 BINDING SITE, designated SEQ ID:40814, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23764] Another function of VGAM538 is therefore inhibition of LOC147165 (Accession XM\_097205). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147165. LOC199232 (Accession XM\_114336) is another VGAM538 host target gene. LOC199232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199232, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199232 BINDING SITE, designated SEQ ID:42879, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23765] Another function of VGAM538 is therefore inhibition of LOC199232 (Accession XM\_114336). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199232. LOC200609 (Accession XM\_117256) is another VGAM538 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43328, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23766] Another function of VGAM538 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200609. LOC200933 (Accession XM\_117294) is another VGAM538 host target gene. LOC200933 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200933 BINDING SITE, designated SEQ ID:43363, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23767] Another function of VGAM538 is therefore inhibition of LOC200933 (Accession XM\_117294). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200933. LOC253664 (Accession XM\_170673) is another VGAM538 host target gene. LOC253664 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253664 BINDING SITE, designated SEQ ID:45449, to the nucleotide sequence of VGAM538 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3249.

[23768] Another function of VGAM538 is therefore inhibition of LOC253664 (Accession XM\_170673). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253664. LOC51026 (Accession NM\_016072) is another VGAM538 host target gene. LOC51026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51026 BINDING SITE, designated SEQ ID:18144, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23769] Another function of VGAM538 is therefore inhibition of LOC51026 (Accession NM\_016072). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51026. LOC91351 (Accession XM\_037817) is another VGAM538 host target gene. LOC91351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91351, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:32696, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23770] Another function of VGAM538 is therefore inhibition of LOC91351 (Accession XM\_037817). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91351. LOC93512 (Accession XM\_051758) is another VGAM538 host target gene. LOC93512 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93512 BINDING SITE, designated SEQ ID:35878, to the nucleotide sequence of VGAM538 RNA, herein designated VGAM RNA, also designated SEQ ID:3249.

[23771] Another function of VGAM538 is therefore inhibition of LOC93512 (Accession XM\_051758). Accordingly, utilities of VGAM538 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC93512. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 539 (VGAM539) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23772] VGAM539 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM539 was detected is described hereinabove with reference to Figs. 1–8.

[23773] VGAM539 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23774] VGAM539 gene encodes a VGAM539 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM539 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM539 precursor RNA is designated SEQ

ID:525, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:525 is located at position 10613 relative to the genome of Bovine Respiratory Syncytial Virus.

[23775] VGAM539 precursor RNA folds onto itself, forming VGAM539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23776] An enzyme complex designated DICER COMPLEX, `dices` the VGAM539 folded precursor RNA into VGAM539 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM539 RNA is designated SEQ ID:3250, and is provided hereinbelow with reference to the sequence

listing part.

[23777] VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM539 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23778] VGAM539 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM539 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM539 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23779] The complementary binding of VGAM539 RNA, herein designated VGAM RNA, to host target binding sites on VGAM539 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM539 host target RNA into VGAM539 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23780] It is appreciated that VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM539 host target genes. The mRNA of each one of this plurality of VGAM539 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM539 RNA, herein designated VGAM

RNA, and which when bound by VGAM539 RNA causes inhibition of translation of respective one or more VGAM539 host target proteins.

[23781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM539 gene, herein designated VGAM GENE, on one or more VGAM539 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23782] It is yet further appreciated that a function of VGAM539 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM539 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM539 correlate with, and may be deduced from, the identity of the host target genes which VGAM539 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23783] Nucleotide sequences of the VGAM539 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM539 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM539 are further described hereinbelow with reference to Table 1.

[23784] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM539 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM539 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23785] As mentioned hereinabove with reference to Fig. 1, a function of VGAM539 gene, herein designated VGAM is

inhibition of expression of VGAM539 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM539 correlate with, and may be deduced from, the identity of the target genes which VGAM539 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23786] Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932) is a VGAM539 host target gene. CDH6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11371, to the nucleotide sequence of VGAM539 RNA, herein designated VGAM RNA, also designated SEQ ID:3250.

[23787] A function of VGAM539 is therefore inhibition of Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM\_004961) is another VGAM539 host target gene. GABRE BINDING SITE1 through GABRE BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GABRE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE1 through GABRE BINDING SITE4, designated SEQ ID:11406, SEQ ID:22508, SEQ ID:22512 and SEQ ID:22527 respectively, to the nucleotide sequence of VGAM539 RNA, herein designated VGAM RNA, also designated SEQ ID:3250.

[23788] Another function of VGAM539 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM\_004961), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRE. The function of GABRE

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. Pim-2 Oncogene (PIM2, Accession XM\_010208) is another VGAM539 host target gene. PIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM2 BINDING SITE, designated SEQ ID:30132, to the nucleotide sequence of VGAM539 RNA, herein designated VGAM RNA, also designated SEQ ID:3250.

[23789] Another function of VGAM539 is therefore inhibition of Pim-2 Oncogene (PIM2, Accession XM\_010208). Accordingly, utilities of VGAM539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIM2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 540 (VGAM540) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[23790] VGAM540 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM540 was detected is described hereinabove with reference to Figs. 1–8.

[23791] VGAM540 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM540 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23792] VGAM540 gene encodes a VGAM540 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM540 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM540 precursor RNA is designated SEQ ID:526, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:526 is located at position 14011 relative to the genome of Bovine Respiratory Syncytial Virus.

[23793] VGAM540 precursor RNA folds onto itself, forming VGAM540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[23794] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM540 folded precursor RNA into VGAM540 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 74%) nucleotide se-  
quence of VGAM540 RNA is designated SEQ ID:3251, and  
is provided hereinbelow with reference to the sequence  
listing part.

[23795] VGAM540 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM540 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM540 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[23796] VGAM540 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM540 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM540 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[23797] The complementary binding of VGAM540 RNA, herein designated VGAM RNA, to host target binding sites on VGAM540 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM540 host target RNA into VGAM540 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23798] It is appreciated that VGAM540 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM540 host target genes. The mRNA of each one of this plurality of VGAM540 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM540 RNA, herein designated VGAM RNA, and which when bound by VGAM540 RNA causes inhibition of translation of respective one or more VGAM540 host target proteins.

[23799] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM540 gene, herein designated VGAM GENE, on one or

more VGAM540 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23800] It is yet further appreciated that a function of VGAM540 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM540 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM540 correlate with, and may be deduced from, the identity of the host target genes which VGAM540 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [23801] Nucleotide sequences of the VGAM540 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM540 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM540 are further described hereinbelow with reference to Table 1.
- [23802] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM540 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM540 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [23803] As mentioned hereinabove with reference to Fig. 1, a function of VGAM540 gene, herein designated VGAM is inhibition of expression of VGAM540 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM540 correlate with, and may be deduced from, the identity of the target genes which VGAM540 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [23804] NCK Adaptor Protein 1 (NCK1, Accession NM\_006153) is a

VGAM540 host target gene. NCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCK1 BINDING SITE, designated SEQ ID:12809, to the nucleotide sequence of VGAM540 RNA, herein designated VGAM RNA, also designated SEQ ID:3251.

[23805] A function of VGAM540 is therefore inhibition of NCK Adaptor Protein 1 (NCK1, Accession NM\_006153). Accordingly, utilities of VGAM540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCK1. Oxysterol Binding Protein-like 11 (OSBPL11, Accession NM\_022776) is another VGAM540 host target gene. OSBPL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL11 BINDING SITE, designated SEQ ID:23046, to the nucleotide sequence of VGAM540 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3251.

[23806] Another function of VGAM540 is therefore inhibition of Oxysterol Binding Protein-like 11 (OSBPL11, Accession NM\_022776). Accordingly, utilities of VGAM540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL11. Thioesterase, Adipose Associated (THEA, Accession XM\_038922) is another VGAM540 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32948, to the nucleotide sequence of VGAM540 RNA, herein designated VGAM RNA, also designated SEQ ID:3251.

[23807] Another function of VGAM540 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM\_038922). Accordingly, utilities of VGAM540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. LOC199796 (Accession XM\_058994) is another VGAM540 host target gene. LOC199796 BINDING SITE is HOST TARGET binding

site found in the 5' untranslated region of mRNA encoded by LOC199796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36805, to the nucleotide sequence of VGAM540 RNA, herein designated VGAM RNA, also designated SEQ ID:3251.

[23808] Another function of VGAM540 is therefore inhibition of LOC199796 (Accession XM\_058994). Accordingly, utilities of VGAM540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 541 (VGAM541) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23809] VGAM541 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM541 was detected is described hereinabove with reference to Figs. 1-8.

[23810] VGAM541 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23811] VGAM541 gene encodes a VGAM541 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM541 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM541 precursor RNA is designated SEQ ID:527, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:527 is located at position 14726 relative to the genome of Bovine Respiratory Syncytial Virus.

[23812] VGAM541 precursor RNA folds onto itself, forming VGAM541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[23813] An enzyme complex designated DICER COMPLEX, `dices` the VGAM541 folded precursor RNA into VGAM541 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM541 RNA is designated SEQ ID:3252, and is provided hereinbelow with reference to the sequence listing part.

[23814] VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM541 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23815] VGAM541 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM541 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM541 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM541 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23816] The complementary binding of VGAM541 RNA, herein designated VGAM RNA, to host target binding sites on VGAM541 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM541 host target RNA into VGAM541 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23817] It is appreciated that VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM541 host target genes. The mRNA of each one of this plurality of VGAM541 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM541 RNA, herein designated VGAM RNA, and which when bound by VGAM541 RNA causes inhibition of translation of respective one or more VGAM541 host target proteins.

[23818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM541 gene, herein designated VGAM GENE, on one or more VGAM541 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23819] It is yet further appreciated that a function of VGAM541 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM541 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM541 correlate with, and may be deduced from, the identity of the host target genes which VGAM541 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23820] Nucleotide sequences of the VGAM541 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM541 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM541 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM541 are further described hereinbelow with reference to Table 1.

[23821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM541 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM541 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23822] As mentioned hereinabove with reference to Fig. 1, a function of VGAM541 gene, herein designated VGAM is inhibition of expression of VGAM541 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM541 correlate with, and may be deduced from, the identity of the target genes which VGAM541 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23823] HSA249128 (Accession NM\_017583) is a VGAM541 host target gene. HSA249128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19023, to the nucleotide sequence of VGAM541 RNA, herein designated VGAM RNA, also designated SEQ ID:3252.

[23824] A function of VGAM541 is therefore inhibition of HSA249128 (Accession NM\_017583). Accordingly, utilities of VGAM541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA249128. KIAA1005 (Accession XM\_051197) is another VGAM541 host target gene. KIAA1005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1005 BINDING SITE, designated SEQ ID:35779, to the nucleotide sequence of VGAM541 RNA, herein designated VGAM RNA, also designated SEQ ID:3252.

[23825] Another function of VGAM541 is therefore inhibition of KIAA1005 (Accession XM\_051197). Accordingly, utilities of VGAM541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1005. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 542 (VGAM542) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23826] VGAM542 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM542 was detected is described hereinabove with reference to Figs. 1–8.

[23827] VGAM542 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM542 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23828] VGAM542 gene encodes a VGAM542 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM542 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM542 precursor RNA is designated SEQ ID:528, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:528 is

located at position 229631 relative to the genome of *Melanoplus Sanguinipes* Entomopoxvirus.

[23829] VGAM542 precursor RNA folds onto itself, forming VGAM542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23830] An enzyme complex designated DICER COMPLEX, `dices` the VGAM542 folded precursor RNA into VGAM542 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM542 RNA is designated SEQ ID:3253, and is provided hereinbelow with reference to the sequence listing part.

[23831] VGAM542 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM542 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[23832] VGAM542 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM542 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM542 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM542 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23833] The complementary binding of VGAM542 RNA, herein designated VGAM RNA, to host target binding sites on VGAM542 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM542 host target RNA into VGAM542 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23834] It is appreciated that VGAM542 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM542 host target genes. The mRNA of each one of this plurality of VGAM542 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM542 RNA, herein designated VGAM RNA, and which when bound by VGAM542 RNA causes inhibition of translation of respective one or more VGAM542

host target proteins.

[23835] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM542 gene, herein designated VGAM GENE, on one or more VGAM542 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23836] It is yet further appreciated that a function of VGAM542 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes En-

tomopoxvirus. Specific functions, and accordingly utilities, of VGAM542 correlate with, and may be deduced from, the identity of the host target genes which VGAM542 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23837] Nucleotide sequences of the VGAM542 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM542 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM542 are further described hereinbelow with reference to Table 1.

[23838] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM542 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM542 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23839] As mentioned hereinabove with reference to Fig. 1, a function of VGAM542 gene, herein designated VGAM is inhibition of expression of VGAM542 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM542 correlate with, and may be deduced from, the identity of the target genes which VGAM542 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23840] Endothelin Receptor Type A (EDNRA, Accession XM\_034331) is a VGAM542 host target gene. EDNRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDNRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDNRA BINDING SITE, designated SEQ ID:32060, to the nucleotide sequence of VGAM542 RNA, herein designated VGAM RNA, also designated SEQ ID:3253.

[23841] A function of VGAM542 is therefore inhibition of Endothelin Receptor Type A (EDNRA, Accession XM\_034331), a gene which binds endothelins, and induces intracellular calcium flux and arachidonic acid accumulation. Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDNRA. The function of EDNRA and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

in above with reference to VGAM441. Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM\_006731) is another VGAM542 host target gene. FCMD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCMD BINDING SITE, designated SEQ ID:13571, to the nucleotide sequence of VGAM542 RNA, herein designated VGAM RNA, also designated SEQ ID:3253.

[23842] Another function of VGAM542 is therefore inhibition of Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM\_006731). Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCMD. Inhibitor of Growth Family, Member 1 (ING1, Accession NM\_005537) is another VGAM542 host target gene. ING1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ING1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ING1 BINDING SITE, designated SEQ ID:12060, to the nucleotide sequence of VGAM542 RNA, herein designated VGAM RNA, also designated SEQ ID:3253.

[23843] Another function of VGAM542 is therefore inhibition of Inhibitor of Growth Family, Member 1 (ING1, Accession NM\_005537), a gene which acts as a potent growth regulator in normal and in established cells. Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ING1. The function of ING1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM170.DKFZP434C1715 (Accession XM\_098421) is another VGAM542 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41671, to the nucleotide sequence of VGAM542 RNA, herein designated VGAM RNA, also designated SEQ ID:3253.

[23844] Another function of VGAM542 is therefore inhibition of DKFZP434C1715 (Accession XM\_098421). Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C1715. Oxysterol Binding Protein-like 1A (OSBPL1A, Accession NM\_080597) is another VGAM542 host target gene. OSBPL1A BINDING SITE1 through OSBPL1A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL1A BINDING SITE1 through OSBPL1A BINDING SITE3, designated SEQ ID:27906, SEQ ID:28423 and SEQ ID:19771 respectively, to the nucleotide sequence of VGAM542 RNA, herein designated VGAM RNA, also designated SEQ ID:3253.

[23845] Another function of VGAM542 is therefore inhibition of Oxysterol Binding Protein-like 1A (OSBPL1A, Accession NM\_080597). Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL1A. LOC220038 (Accession XM\_166257) is another VGAM542 host target

gene. LOC220038 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220038 BINDING SITE, designated SEQ ID:44079, to the nucleotide sequence of VGAM542 RNA, herein designated VGAM RNA, also designated SEQ ID:3253.

[23846] Another function of VGAM542 is therefore inhibition of LOC220038 (Accession XM\_166257). Accordingly, utilities of VGAM542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 543 (VGAM543) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23847] VGAM543 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM543 was detected is described

hereinabove with reference to Figs. 1–8.

[23848] VGAM543 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23849] VGAM543 gene encodes a VGAM543 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM543 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM543 precursor RNA is designated SEQ ID:529, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:529 is located at position 179507 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[23850] VGAM543 precursor RNA folds onto itself, forming VGAM543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[23851] An enzyme complex designated DICER COMPLEX, `dices` the VGAM543 folded precursor RNA into VGAM543 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM543 RNA is designated SEQ ID:3254, and is provided hereinbelow with reference to the sequence listing part.

[23852] VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM543 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23853] VGAM543 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM543 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM543 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM543 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23854] The complementary binding of VGAM543 RNA, herein designated VGAM RNA, to host target binding sites on VGAM543 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM543 host target RNA into VGAM543 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23855] It is appreciated that VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM543 host target genes. The mRNA of each one of this plurality of VGAM543 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM543 RNA, herein designated VGAM RNA, and which when bound by VGAM543 RNA causes inhibition of translation of respective one or more VGAM543 host target proteins.

[23856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM543 gene, herein designated VGAM GENE, on one or more VGAM543 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23857] It is yet further appreciated that a function of VGAM543 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM543 correlate with, and may be deduced from, the identity of the host target genes which VGAM543 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23858] Nucleotide sequences of the VGAM543 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM543 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM543 are further described hereinbelow with reference to Table 1.

[23859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM543 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM543 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23860] As mentioned hereinabove with reference to Fig. 1, a function of VGAM543 gene, herein designated VGAM is inhibition of expression of VGAM543 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM543 correlate with, and may be deduced from, the identity of the target genes which VGAM543 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23861] C1D (Accession NM\_006333) is a VGAM543 host target gene. C1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of C1D BINDING SITE, designated SEQ ID:13031, to the nucleotide sequence of VGAM543 RNA, herein designated VGAM RNA, also designated SEQ ID:3254.

[23862] A function of VGAM543 is therefore inhibition of C1D (Accession NM\_006333), a gene which is similar to murine C1D and may be a component of nuclear hormone receptor complexes. Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1D. The function of C1D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM78.Serum/glucocorticoid Regulated Kinase (SGK, Accession NM\_005627) is another VGAM543 host target gene. SGK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGK BINDING SITE, designated SEQ ID:12139, to the nucleotide sequence of VGAM543 RNA, herein designated VGAM RNA, also designated SEQ ID:3254.

[23863] Another function of VGAM543 is therefore inhibition of Serum/glucocorticoid Regulated Kinase (SGK, Accession NM\_005627), a gene which Serine/threonine kinase. Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGK. The function of SGK has been established by previous studies. Transforming growth factor-beta (TGFB1; 190180) participates in the pathophysiology of diabetic complications. TGF-beta stimulates the expression of SGK. Lang et al. (2000) demonstrated markedly enhanced transcription of SGK in diabetic nephropathy, with particularly high expression in mesangial cells, interstitial cells, and cells in the thick ascending limbs of the loop of Henle and distal tubules. The enhanced SGK transcription, which results from excessive extracellular glucose concentrations, stimulates renal tubular Na(+) transport. These observations disclosed an additional element in the pathophysiology of diabetic nephropathy. Animal model experiments lend further support to the function of SGK. Using differential display PCR, Tsai et al. (2002) identified 98 cDNA fragments from the rat dorsal hippocampus that were expressed differentially between the fast learners and slow learners in the

water maze learning task. One of these cDNA fragments came from the Sgk gene. Northern blot analysis showed that Sgk mRNA levels were approximately 4-fold higher in the hippocampus of fast learners than slow learners. In situ hybridization results indicated that Sgk mRNA levels were increased markedly in the CA1, CA3, and dentate gyrus of the hippocampus of fast learners. Transient transfection of Sgk mutant DNA to the CA1 area of the hippocampus impaired water maze performance in rats, whereas transfection of Sgk wildtype DNA facilitated it.

[23864] It is appreciated that the abovementioned animal model for SGK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[23865] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Nat. Acad.

[23868] Further studies establishing the function and utilities of  
SGK are found in John Hopkins OMIM database record ID  
602958, and in cited publications numbered 2503,  
8644-864 and 8474-8475 listed in the bibliography sec-  
tion hereinbelow, which are also hereby incorporated by  
reference. Chromosome 12 Open Reading Frame 22  
(C12orf22, Accession NM\_030809) is another VGAM543  
host target gene. C12orf22 BINDING SITE is HOST TARGET  
binding site found in the 3' untranslated region of mRNA  
encoded by C12orf22, corresponding to a HOST TARGET  
binding site such as BINDING SITE I, BINDING SITE II or  
BINDING SITE III. Table 2 illustrates the complementarity  
of the nucleotide sequences of C12orf22 BINDING SITE,  
designated SEQ ID:25130, to the nucleotide sequence of  
VGAM543 RNA, herein designated VGAM RNA, also desig-  
nated SEQ ID:3254.

[23869] Another function of VGAM543 is therefore inhibition of  
Chromosome 12 Open Reading Frame 22 (C12orf22, Ac-  
cession NM\_030809). Accordingly, utilities of VGAM543

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf22. GG2-1 (Accession NM\_014350) is another VGAM543 host target gene. GG2-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GG2-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GG2-1 BINDING SITE, designated SEQ ID:15678, to the nucleotide sequence of VGAM543 RNA, herein designated VGAM RNA, also designated SEQ ID:3254.

[23870] Another function of VGAM543 is therefore inhibition of GG2-1 (Accession NM\_014350). Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GG2-1. HT008 (Accession XM\_008246) is another VGAM543 host target gene. HT008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HT008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT008 BINDING SITE, designated SEQ

ID:30072, to the nucleotide sequence of VGAM543 RNA, herein designated VGAM RNA, also designated SEQ ID:3254.

[23871] Another function of VGAM543 is therefore inhibition of HT008 (Accession XM\_008246). Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT008. KIAA0820 (Accession XM\_044463) is another VGAM543 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34218, to the nucleotide sequence of VGAM543 RNA, herein designated VGAM RNA, also designated SEQ ID:3254.

[23872] Another function of VGAM543 is therefore inhibition of KIAA0820 (Accession XM\_044463). Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_014418) is another VGAM543 host target gene. TCL6

BINDING SITE1 and TCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:15766 and SEQ ID:21760 respectively, to the nucleotide sequence of VGAM543 RNA, herein designated VGAM RNA, also designated SEQ ID:3254.

[23873] Another function of VGAM543 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM\_014418). Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. LOC154792 (Accession XM\_098608) is another VGAM543 host target gene. LOC154792 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154792 BINDING SITE, designated SEQ ID:41728, to the nucleotide sequence of

VGAM543 RNA, herein designated VGAM RNA, also designated SEQ ID:3254.

[23874] Another function of VGAM543 is therefore inhibition of LOC154792 (Accession XM\_098608). Accordingly, utilities of VGAM543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154792. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 544 (VGAM544) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23875] VGAM544 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM544 was detected is described hereinabove with reference to Figs. 1–8.

[23876] VGAM544 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Spleen and Kidney Necrosis Virus. VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23877] VGAM544 gene encodes a VGAM544 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM544 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM544 precursor RNA is designated SEQ ID:530, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:530 is located at position 22231 relative to the genome of Infectious Spleen and Kidney Necrosis Virus.

[23878] VGAM544 precursor RNA folds onto itself, forming VGAM544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23879] An enzyme complex designated DICER COMPLEX, `dices` the VGAM544 folded precursor RNA into VGAM544 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM544 RNA is designated SEQ ID:3255, and is provided hereinbelow with reference to the sequence listing part.

[23880] VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM544 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[23881] VGAM544 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM544 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM544 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23882] The complementary binding of VGAM544 RNA, herein designated VGAM RNA, to host target binding sites on VGAM544 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM544 host target RNA into VGAM544 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23883] It is appreciated that VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM544 host target genes. The mRNA of each one of this plurality of VGAM544 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM544 RNA, herein designated VGAM RNA, and which when bound by VGAM544 RNA causes inhibition of translation of respective one or more VGAM544 host target proteins.

[23884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM544 gene, herein designated VGAM GENE, on one or more VGAM544 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[23885] It is yet further appreciated that a function of VGAM544 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM544 include diagnosis, prevention and treatment of viral infection by Infectious Spleen and Kidney Necrosis Virus. Specific functions, and accordingly utilities, of VGAM544 correlate with, and may be deduced from, the identity of the host target genes which VGAM544 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23886] Nucleotide sequences of the VGAM544 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM544 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM544 are further described hereinbelow with reference to Table 1.

[23887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM544 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM544 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23888] As mentioned hereinabove with reference to Fig. 1, a function of VGAM544 gene, herein designated VGAM is inhibition of expression of VGAM544 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM544 correlate with, and may be deduced from, the identity of the target genes which VGAM544 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23889] PDX1 (Accession NM\_003477) is a VGAM544 host target gene. PDX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDX1 BINDING SITE, designated SEQ ID:9547, to the nucleotide sequence of VGAM544 RNA, herein designated VGAM RNA, also designated SEQ ID:3255.

[23890] A function of VGAM544 is therefore inhibition of PDX1 (Accession NM\_003477). Accordingly, utilities of VGAM544 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PDX1.

S164 (Accession XM\_027330) is another VGAM544 host target gene. S164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S164 BINDING SITE, designated SEQ ID:30483, to the nucleotide sequence of VGAM544 RNA, herein designated VGAM RNA, also designated SEQ ID:3255.

[23891] Another function of VGAM544 is therefore inhibition of S164 (Accession XM\_027330). Accordingly, utilities of VGAM544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S164. LOC153338 (Accession XM\_098361) is another VGAM544 host target gene. LOC153338 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153338 BINDING SITE, designated SEQ ID:41610, to the nucleotide se-

quence of VGAM544 RNA, herein designated VGAM RNA, also designated SEQ ID:3255.

[23892] Another function of VGAM544 is therefore inhibition of LOC153338 (Accession XM\_098361). Accordingly, utilities of VGAM544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153338. LOC220936 (Accession XM\_166137) is another VGAM544 host target gene. LOC220936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220936 BINDING SITE, designated SEQ ID:43930, to the nucleotide sequence of VGAM544 RNA, herein designated VGAM RNA, also designated SEQ ID:3255.

[23893] Another function of VGAM544 is therefore inhibition of LOC220936 (Accession XM\_166137). Accordingly, utilities of VGAM544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220936. LOC92973 (Accession XM\_048529) is another VGAM544 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35184, to the nucleotide sequence of VGAM544 RNA, herein designated VGAM RNA, also designated SEQ ID:3255.

[23894] Another function of VGAM544 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities of VGAM544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 545 (VGAM545) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23895] VGAM545 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM545 was detected is described hereinabove with reference to Figs. 1–8.

[23896] VGAM545 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23897] VGAM545 gene encodes a VGAM545 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM545 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM545 precursor RNA is designated SEQ ID:531, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:531 is located at position 205892 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[23898] VGAM545 precursor RNA folds onto itself, forming VGAM545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23899] An enzyme complex designated DICER COMPLEX, `dices` the VGAM545 folded precursor RNA into VGAM545 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM545 RNA is designated SEQ ID:3256, and is provided hereinbelow with reference to the sequence listing part.

[23900] VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM545 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23901] VGAM545 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM545 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM545 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[23902] The complementary binding of VGAM545 RNA, herein designated VGAM RNA, to host target binding sites on VGAM545 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM545 host tar-

get RNA into VGAM545 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23903] It is appreciated that VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM545 host target genes. The mRNA of each one of this plurality of VGAM545 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM545 RNA, herein designated VGAM RNA, and which when bound by VGAM545 RNA causes inhibition of translation of respective one or more VGAM545 host target proteins.

[23904] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM545 gene, herein designated VGAM GENE, on one or more VGAM545 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23905] It is yet further appreciated that a function of VGAM545 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM545 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM545 correlate with, and may be deduced from, the identity of the host target genes which VGAM545 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23906] Nucleotide sequences of the VGAM545 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM545 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM545 are further

described hereinbelow with reference to Table 1.

[23907] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM545 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM545 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23908] As mentioned hereinabove with reference to Fig. 1, a function of VGAM545 gene, herein designated VGAM is inhibition of expression of VGAM545 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM545 correlate with, and may be deduced from, the identity of the target genes which VGAM545 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23909] Sirtuin Silent Mating Type Information Regulation 2 Homolog 5 (*S. cerevisiae*) (SIRT5, Accession NM\_012241) is a VGAM545 host target gene. SIRT5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIRT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of SIRT5 BINDING SITE, designated SEQ ID:14547, to the nucleotide sequence of VGAM545 RNA, herein designated VGAM RNA, also designated SEQ ID:3256.

[23910] A function of VGAM545 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 5 (*S. cerevisiae*) (SIRT5, Accession NM\_012241), a gene which acts as a nad-dependent histone deacetylase; silences transcription at telomeres and the ribosomal dna. Accordingly, utilities of VGAM545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT5. The function of SIRT5 has been established by previous studies. The yeast Sir2 protein (Shore et al., 1984) regulates epigenetic gene silencing and, as a possible antiaging effect, suppresses recombination of rDNA. Studies involving cobB, a bacterial Sir2-like gene, have suggested that Sir2 may encode a pyridine nucleotide transferase. By in silico and PCR-cloning techniques, Frye (1999) obtained cDNA sequences encoding 5 human Sir2-like genes, which they called sirtuin-1 to -5 (SIRT1 to SIRT5). The SIRT1 (OMIM Ref. No. 604479) sequence has the closest homology to the *S. cerevisiae* Sir2 protein, while SIRT4 (OMIM Ref. No.

604482) and SIRT5 more closely resemble prokaryotic sirtuin sequences. PCR analysis showed that the 5 human sirtuins are widely expressed in fetal and adult tissues. Recombinant human SIRT2 (OMIM Ref. No. 604480) was able to cause radioactivity to be transferred from (32P)NAD to bovine serum albumin (BSA). When a conserved histidine within SIRT2 was converted to tyrosine, the mutant recombinant protein was unable to transfer radioactivity from (32P)NAD to BSA. These results suggested that the sirtuins may function via mono-ADP-ribosylation of proteins. Tanny et al. (1999) showed that the yeast Sir2 protein can transfer labeled phosphate from nicotinamide adenine dinucleotide to itself and histones in vitro. A modified form of Sir2, which results from its automodification activity, was specifically recognized by anti-mono-ADP-ribose antibodies, suggesting that Sir2 is an ADP-ribosyltransferase. Mutation of a phylogenetically invariant histidine (his364 to tyr) in Sir2 abolished both its enzymatic activity in vitro and its silencing functions in vivo. However, the mutant protein was associated with chromatin and other silencing factors in a manner similar to wildtype Sir2. These findings suggested that Sir2 contains an ADP-ribosyltransferase activity that

is essential for its silencing function.

[23911] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23912] Frye, R. A. : Characterization of five human cDNAs with homology to the yeast SIR2 gene: Sir2-like proteins (sirtuins) metabolize NAD and may have protein ADP-ribosyltransferase activity. Biochem. Biophys. Res. Commun. 260: 273-279, 1999. ; and

[23913] Tanny, J. C.; Dowd, G. J.; Huang, J.; Hilz, H.; Moazed, D. : An enzymatic activity in the yeast Sir2 protein that is essential for gene silencing. Cell 99: 735-745, 1999.

[23914] Further studies establishing the function and utilities of SIRT5 are found in John Hopkins OMIM database record ID 604483, and in cited publications numbered 5008, 504 and 5051 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Chromosome 20 Open Reading Frame 106

(C20orf106, Accession NM\_080824) is another VGAM545

host target gene. C20orf106 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of

mRNA encoded by C20orf106, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf106 BINDING SITE, designated SEQ ID:28090, to the nucleotide sequence of VGAM545 RNA, herein designated VGAM RNA, also designated SEQ ID:3256.

[23915] Another function of VGAM545 is therefore inhibition of Chromosome 20 Open Reading Frame 106 (C20orf106, Accession NM\_080824). Accordingly, utilities of VGAM545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf106.

LOC151248 (Accession XM\_087143) is another VGAM545 host target gene. LOC151248 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39082, to the nucleotide sequence of VGAM545 RNA, herein designated VGAM RNA, also designated SEQ ID:3256.

[23916] Another function of VGAM545 is therefore inhibition of LOC151248 (Accession XM\_087143). Accordingly, utilities of VGAM545 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151248. LOC90408 (Accession XM\_031517) is another VGAM545 host target gene. LOC90408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:31393, to the nucleotide sequence of VGAM545 RNA, herein designated VGAM RNA, also designated SEQ ID:3256.

[23917] Another function of VGAM545 is therefore inhibition of LOC90408 (Accession XM\_031517). Accordingly, utilities of VGAM545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 546 (VGAM546) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23918] VGAM546 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM546 was detected is described hereinabove with reference to Figs. 1–8.

[23919] VGAM546 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Stunt Virus.

VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23920] VGAM546 gene encodes a VGAM546 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM546 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM546 precursor RNA is designated SEQ ID:532, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:532 is located at position 1857 relative to the genome of Peanut Stunt Virus.

[23921] VGAM546 precursor RNA folds onto itself, forming VGAM546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23922] An enzyme complex designated DICER COMPLEX, `dices` the VGAM546 folded precursor RNA into VGAM546 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM546 RNA is designated SEQ ID:3257, and is provided hereinbelow with reference to the sequence listing part.

[23923] VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM546 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23924] VGAM546 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM546 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM546 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23925] The complementary binding of VGAM546 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM546 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM546 host target RNA into VGAM546 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23926] It is appreciated that VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM546 host target genes. The mRNA of each one of this plurality of VGAM546 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM546 RNA, herein designated VGAM RNA, and which when bound by VGAM546 RNA causes inhibition of translation of respective one or more VGAM546 host target proteins.

[23927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM546 gene, herein designated VGAM GENE, on one or more VGAM546 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23928] It is yet further appreciated that a function of VGAM546 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM546 include diagnosis, prevention and treatment of viral infection by Peanut Stunt Virus. Specific functions, and accordingly utilities, of VGAM546 correlate with, and may be deduced from, the identity of the host target genes which VGAM546 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23929] Nucleotide sequences of the VGAM546 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM546 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM546 are further described hereinbelow with reference to Table 1.

[23930] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM546 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM546 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23931] As mentioned hereinabove with reference to Fig. 1, a function of VGAM546 gene, herein designated VGAM is inhibition of expression of VGAM546 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM546 correlate with, and may be deduced from, the identity of the target genes which VGAM546 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23932] Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM\_016557) is a VGAM546 host target gene. CCRL1 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by CCRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCRL1 BINDING SITE, designated SEQ ID:18632, to the nucleotide sequence of VGAM546 RNA, herein designated VGAM RNA, also designated SEQ ID:3257.

[23933] A function of VGAM546 is therefore inhibition of Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM\_016557), a gene which is a G protein-coupled receptor that binds chemokines of the CC subfamily, especially MCP-4, ELC (SCYA19) and TECK (SCYA25). Accordingly, utilities of VGAM546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRL1. The function of CCRL1 has been established by previous studies. Chemokine receptors are members of the 7-transmembrane-spanning, G protein-coupled receptor family that recognize small proteins responsible for the directed migration of specific cell types. Depending on the number of amino acids between the first 2 cysteines of their ligands (they may have more than 1 ligand), chemokine receptors are designated CCR (adjacent cysteines), CXCR (1 amino acid between the cysteines), or

CX3CR (3 amino acids between the cysteines). The 'R' designation refers to proteins that not only bind, but also have a signaling function after binding. By searching an EST database for PPR1 homologs, Schweickart et al. (2000) obtained a cDNA encoding CCRL1, which they called CCR11. They initially reported that CCRL1 shares functional similarity to CCR2 (OMIM Ref. No. 601267) because it has a chemotactic response to MCP family chemokines (e.g., MCP2; 602283). However, in an erratum, Schweickart et al. (2000) corrected their functional data and stated that cells expressing CCRL1 do not have a chemotactic response to MCP family chemokines. They confirmed that CCRL1 binds ELC, SLC, and TECK, as reported by Gosling et al. (2000).

[23934] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23935] Schweickart, V. L.; Epp, A.; Raport, C. J.; Gray, P. W. : CCR11 is a functional receptor for the monocyte chemoattractant protein family of chemokines. J. Biol. Chem. 275: 9550–9556, 2000. Note: Erratum: J. Biol. Chem. 276: 856 only, 2001. ; and

[23936] Gosling, J.; Dairaghi, D. J.; Wang, Y.; Hanley, M.; Talbot,

D.; Miao, Z.; Schall, T. J. : Cutting edge: identification of a novel chemokine receptor that binds dendritic cell- and T cel.

[23937] Further studies establishing the function and utilities of CCRL1 are found in John Hopkins OMIM database record ID 606065, and in cited publications numbered 6908–6339 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC200845 (Accession XM\_114305) is another VGAM546 host target gene. LOC200845 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200845 BINDING SITE, designated SEQ ID:42862, to the nucleotide sequence of VGAM546 RNA, herein designated VGAM RNA, also designated SEQ ID:3257.

[23938] Another function of VGAM546 is therefore inhibition of LOC200845 (Accession XM\_114305). Accordingly, utilities of VGAM546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200845. LOC221975 (Accession XM\_166534) is an–

other VGAM546 host target gene. LOC221975 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221975 BINDING SITE, designated SEQ ID:44497, to the nucleotide sequence of VGAM546 RNA, herein designated VGAM RNA, also designated SEQ ID:3257.

[23939] Another function of VGAM546 is therefore inhibition of LOC221975 (Accession XM\_166534). Accordingly, utilities of VGAM546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221975. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 547 (VGAM547) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23940] VGAM547 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM547 was detected is described

hereinabove with reference to Figs. 1–8.

[23941] VGAM547 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut Stunt Virus.

VGAM547 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23942] VGAM547 gene encodes a VGAM547 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM547 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM547 precursor RNA is designated SEQ ID:533, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:533 is located at position 1186 relative to the genome of Peanut Stunt Virus.

[23943] VGAM547 precursor RNA folds onto itself, forming VGAM547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23944] An enzyme complex designated DICER COMPLEX, `dices` the VGAM547 folded precursor RNA into VGAM547 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM547 RNA is designated SEQ ID:3258, and is provided hereinbelow with reference to the sequence listing part.

[23945] VGAM547 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM547 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23946] VGAM547 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM547 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM547 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM547 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23947] The complementary binding of VGAM547 RNA, herein designated VGAM RNA, to host target binding sites on VGAM547 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM547 host target RNA into VGAM547 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23948] It is appreciated that VGAM547 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM547 host target genes. The mRNA of each one of this plurality of VGAM547 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM547 RNA, herein designated VGAM RNA, and which when bound by VGAM547 RNA causes inhibition of translation of respective one or more VGAM547 host target proteins.

[23949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM547 gene, herein designated VGAM GENE, on one or more VGAM547 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23950] It is yet further appreciated that a function of VGAM547 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM547 include diagnosis, prevention and treatment of viral infection by Peanut Stunt Virus. Specific functions, and accordingly utilities, of VGAM547 correlate with, and may be deduced from, the identity of the host target genes which VGAM547 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23951] Nucleotide sequences of the VGAM547 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM547 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM547 are further described hereinbelow with reference to Table 1.

[23952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM547 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM547 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23953] As mentioned hereinabove with reference to Fig. 1, a function of VGAM547 gene, herein designated VGAM is inhibition of expression of VGAM547 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM547 correlate with, and may be deduced from, the identity of the target genes which VGAM547 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23954] Aspartate Beta-hydroxylase (ASPH, Accession NM\_032466) is a VGAM547 host target gene. ASPH BINDING SITE1 and ASPH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ASPH, corresponding to HOST TARGET binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE1 and ASPH BINDING SITE2, designated SEQ ID:26224 and SEQ ID:26228 respectively, to the nucleotide sequence of VGAM547 RNA, herein designated VGAM RNA, also designated SEQ ID:3258.

[23955] A function of VGAM547 is therefore inhibition of Aspartate Beta-hydroxylase (ASPH, Accession NM\_032466), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)-like domains of a number of proteins. Accordingly, utilities of VGAM547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH. The function of ASPH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47. Solute Carrier Family 17 (sodium phosphate), Member 4 (SLC17A4, Accession NM\_005495) is another VGAM547 host target gene. SLC17A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A4, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A4 BINDING SITE, designated SEQ ID:11998, to the nucleotide sequence of VGAM547 RNA, herein designated VGAM RNA, also designated SEQ ID:3258.

[23956] Another function of VGAM547 is therefore inhibition of Solute Carrier Family 17 (sodium phosphate), Member 4 (SLC17A4, Accession NM\_005495). Accordingly, utilities of VGAM547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A4. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM\_086728) is another VGAM547 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38833, to the nucleotide sequence of VGAM547 RNA, herein designated VGAM RNA, also designated SEQ ID:3258.

[23957] Another function of VGAM547 is therefore inhibition of

Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM\_086728). Accordingly, utilities of VGAM547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. Zinc Finger Protein 323 (ZNF323, Accession NM\_030899) is another VGAM547 host target gene. ZNF323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:25168, to the nucleotide sequence of VGAM547 RNA, herein designated VGAM RNA, also designated SEQ ID:3258.

[23958] Another function of VGAM547 is therefore inhibition of Zinc Finger Protein 323 (ZNF323, Accession NM\_030899). Accordingly, utilities of VGAM547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323. LOC149619 (Accession XM\_097690) is another VGAM547 host target gene. LOC149619 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149619, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149619 BINDING SITE, designated SEQ ID:41027, to the nucleotide sequence of VGAM547 RNA, herein designated VGAM RNA, also designated SEQ ID:3258.

[23959] Another function of VGAM547 is therefore inhibition of LOC149619 (Accession XM\_097690). Accordingly, utilities of VGAM547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149619. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 548 (VGAM548) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23960] VGAM548 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM548 was detected is described hereinabove with reference to Figs. 1–8.

[23961] VGAM548 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Leaf Curl Virus.

VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23962] VGAM548 gene encodes a VGAM548 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM548 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM548 precursor RNA is designated SEQ ID:534, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:534 is located at position 462 relative to the genome of Tomato Leaf Curl Virus.

[23963] VGAM548 precursor RNA folds onto itself, forming VGAM548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23964] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM548 folded precursor RNA into VGAM548 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM548 RNA is designated SEQ ID:3259, and is provided hereinbelow with reference to the sequence listing part.

[23965] VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM548 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[23966] VGAM548 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM548 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM548 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[23967] The complementary binding of VGAM548 RNA, herein designated VGAM RNA, to host target binding sites on VGAM548 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM548 host target RNA into VGAM548 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[23968] It is appreciated that VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM548 host target genes. The mRNA of each one of this plurality of VGAM548 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM548 RNA, herein designated VGAM RNA, and which when bound by VGAM548 RNA causes inhibition of translation of respective one or more VGAM548 host target proteins.

[23969] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM548 gene, herein designated VGAM GENE, on one or more VGAM548 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[23970] It is yet further appreciated that a function of VGAM548 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of viral infection by Tomato Leaf Curl Virus. Specific functions, and accordingly utilities, of VGAM548 correlate with, and may be deduced from, the identity of the host target genes which VGAM548 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[23971] Nucleotide sequences of the VGAM548 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM548 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM548 are further described hereinbelow with reference to Table 1.

[23972] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM548 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM548 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[23973] As mentioned hereinabove with reference to Fig. 1, a function of VGAM548 gene, herein designated VGAM is inhibition of expression of VGAM548 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM548 correlate with, and may be deduced from, the identity of the target genes which VGAM548 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[23974] KIAA0857 (Accession XM\_039552) is a VGAM548 host target gene. KIAA0857 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0857, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0857 BINDING SITE, designated SEQ ID:33120, to the nucleotide sequence of

VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23975] A function of VGAM548 is therefore inhibition of KIAA0857 (Accession XM\_039552), a gene which is involved in cytoskeletal organization and cellular growth. Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0857. The function of KIAA0857 has been established by previous studies. RAB11 (see OMIM Ref. No. 604198) is a GTPase that regulates endosomal trafficking to apical plasma membrane domains in polarized epithelial cells. Using protein purification and microsequence analysis, Prekeris et al. (2000) identified a novel RAB11 effector, which they called RIP11. RIP11 is identical to the KIAA0857 open reading frame (Nagase et al., 1998), which encodes a 653-amino acid protein. Northern blot analysis detected 2 major RIP11 transcripts of 4.4 and 6 kb. Both transcripts were enriched in kidney, while other tissues expressed reduced levels of RIP11. Antibodies recognized a protein doublet of 72 kD. RIP11 was found to be enriched in polarized epithelial cells where, like Rab11, it localized to subapical recycling endosomes (AREs) and the apical plasma membrane. Transport assays

demonstrated that RIP11 is important for protein trafficking from AREs to the apical plasma membrane. RIP11 is recruited to AREs by binding to RAB11, as well as through a  $Mg(2+)$ -dependent interaction of its C2 domain with neutral phospholipids. The association of RIP11 with membranes is regulated by a phosphorylation and dephosphorylation cycle. Prekeris et al. (2000) proposed a model whereby the RAB11/RIP11 complex regulates vesicle targeting from the ARE

[23976] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23977] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Oharo, O. : Prediction of the coding sequences of unidentified human genes. XII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 5: 355–364, 1998. ; and

[23978] Prekeris, R.; Klumperman, J.; Scheller, R. H. : A Rab11/Rip11 protein complex regulates apical membrane trafficking via recycling endosomes. Molec. Cell 6: 1437–1448, 2000.

[23979] Further studies establishing the function and utilities of

KIAA0857 are found in John Hopkins OMIM database record ID 605536, and in cited publications numbered 2011 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM\_004624) is another VGAM548 host target gene. VIPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIPR1 BINDING SITE, designated SEQ ID:10992, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23980] Another function of VGAM548 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM\_004624), a gene which binds vip and is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR1. The function of VIPR1 has been established by previous studies. Vasoactive intestinal peptide (VIP; 192320) is an octacosameric neuroendocrine mediator found pre-

dominantly in cholinergic presynaptic neurons of the central nervous system and in peripheral peptidergic neurons innervating diverse tissues. Of the many neuroendocrine peptides with immunologic functions, VIP is distinguished by its capacity to affect both B and T cells directly. Distinct subsets of neural, respiratory, gastrointestinal, and immune cells bear specific high-affinity receptors for VIP, which are associated with a guanine nucleotide-binding (G) protein capable of activating adenylate cyclase. Libert et al. (1991) obtained 4 new receptors of the G protein-coupled receptor family by selective amplification and cloning from thyroid cDNA. One of these, termed RDC1, was identified as the VIP receptor by Sreedharan et al. (1991). Libert et al. (1991) mapped the VIPR gene to 2q37 by in situ hybridization. Later information made it doubtful that the gene mapped to 2q37 was in fact the VIP receptor gene (Vassart, 1992). The sequence that was designated GPRN1 by Sreedharan et al. (1991) and mapped to 2q37 was found not to bind VIP by Wenger (1993). Sreedharan et al. (1995) isolated an authentic type I VIP receptor gene and by fluorescence in situ hybridization localized it to the 3p22 band in a region associated with small-cell lung cancer. By interspecific backcross analysis,

Hashimoto et al. (1999) mapped the mouse *Vipr1* gene to the distal region of chromosome 9, a region that shows homology of synteny with human chromosome 3p. Sreedharan et al. (1993) cloned a human intestinal VIP receptor gene; the deduced amino acid sequence shares 84% identity with the rat lung VIP receptor. Couvineau et al. (1994) isolated 2 VIPR cDNA clones from a human jejunal epithelial cell cDNA library. One encodes a VIP receptor consisting of 460 amino acids and having 7 putative transmembrane domains, as do other G protein-coupled receptors. The other encodes a 495-amino acid VIP receptor-related protein exhibiting 100% homology with the functional VIP receptor over the 428 amino acids at the C-terminal region, but containing a completely divergent 67-amino acid N-terminal domain. When expressed in COS-7 cells, the second protein did not bind radioiodinated VIP, although it was normally addressed at the plasma membrane as assessed by immunofluorescence studies.

[23981] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[23982] Sreedharan, S. P.; Huang, J.-X.; Cheung, M.-C.; Goetzl, E. J. : Structure, expression, and chromosomal localization of

the type I human vasoactive intestinal peptide receptor gene. Proc. Nat. Acad. Sci. 92: 2939–2943, 1995. ; and

[23983] Couvineau, A.; Rouyer–Fessard, C.; Darmoul, D.; Maoret, J.–J.; Carrero, I.; Ogier–Denis, E.; Laburthe, M. : Human intestinal VIP receptor: cloning and functional expression of two cDNA enc.

[23984] Further studies establishing the function and utilities of VIPR1 are found in John Hopkins OMIM database record ID 192321, and in cited publications numbered 9672–9673, 189, 9674–967 and 9743–9744 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. C16orf5 (Accession NM\_013399) is another VGAM548 host target gene. C16orf5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C16orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:15053, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23985] Another function of VGAM548 is therefore inhibition of C16orf5 (Accession NM\_013399). Accordingly, utilities of

VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5. KIAA0427 (Accession NM\_014772) is another VGAM548 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16575, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23986] Another function of VGAM548 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA1163 (Accession XM\_086231) is another VGAM548 host target gene. KIAA1163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1163 BINDING SITE, designated SEQ ID:38559, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23987] Another function of VGAM548 is therefore inhibition of KIAA1163 (Accession XM\_086231). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1163. KIAA1889 (Accession XM\_056298) is another VGAM548 host target gene. KIAA1889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1889 BINDING SITE, designated SEQ ID:36391, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23988] Another function of VGAM548 is therefore inhibition of KIAA1889 (Accession XM\_056298). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1889. MGC5139 (Accession XM\_058587) is another VGAM548 host target gene. MGC5139 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5139 BINDING SITE, designated SEQ ID:36678, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23989] Another function of VGAM548 is therefore inhibition of MGC5139 (Accession XM\_058587). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5139. PRO2435 (Accession NM\_018527) is another VGAM548 host target gene. PRO2435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2435 BINDING SITE, designated SEQ ID:20602, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23990] Another function of VGAM548 is therefore inhibition of

PRO2435 (Accession NM\_018527). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2435. Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033627) is another VGAM548 host target gene. TREX1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TREX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE, designated SEQ ID:27338, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23991] Another function of VGAM548 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033627). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. LOC113146 (Accession XM\_053817) is another VGAM548 host target gene. LOC113146 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC113146, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113146 BINDING SITE, designated SEQ ID:36128, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23992] Another function of VGAM548 is therefore inhibition of LOC113146 (Accession XM\_053817). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113146. LOC90826 (Accession XM\_034321) is another VGAM548 host target gene. LOC90826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90826 BINDING SITE, designated SEQ ID:32049, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23993] Another function of VGAM548 is therefore inhibition of LOC90826 (Accession XM\_034321). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC90826. LOC92822 (Accession XM\_047520) is another VGAM548 host target gene. LOC92822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92822 BINDING SITE, designated SEQ ID:34984, to the nucleotide sequence of VGAM548 RNA, herein designated VGAM RNA, also designated SEQ ID:3259.

[23994] Another function of VGAM548 is therefore inhibition of LOC92822 (Accession XM\_047520). Accordingly, utilities of VGAM548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92822. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 549 (VGAM549) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[23995] VGAM549 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM549 was detected is described hereinabove with reference to Figs. 1–8.

[23996] VGAM549 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 1–1. VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[23997] VGAM549 gene encodes a VGAM549 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM549 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM549 precursor RNA is designated SEQ ID:535, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:535 is located at position 1399 relative to the genome of Leishmania RNA Virus 1–1.

[23998] VGAM549 precursor RNA folds onto itself, forming VGAM549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[23999] An enzyme complex designated DICER COMPLEX, `dices` the VGAM549 folded precursor RNA into VGAM549 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM549 RNA is designated SEQ ID:3260, and is provided hereinbelow with reference to the sequence listing part.

[24000] VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM549 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24001] VGAM549 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM549 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM549 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24002] The complementary binding of VGAM549 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM549 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM549 host target RNA into VGAM549 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[24003] It is appreciated that VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM549 host target genes. The mRNA of each one of this plurality of VGAM549 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM549 RNA, herein designated VGAM RNA, and which when bound by VGAM549 RNA causes inhibition of translation of respective one or more VGAM549 host target proteins.

[24004] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM549 gene, herein designated VGAM GENE, on one or more VGAM549 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[24005] It is yet further appreciated that a function of VGAM549 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of viral infection by Leishmania RNA Virus 1-1. Specific functions, and accordingly utilities, of VGAM549 correlate with, and may be deduced from, the identity of the host target genes which VGAM549 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[24006] Nucleotide sequences of the VGAM549 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM549 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM549 are further described hereinbelow with reference to Table 1.

[24007] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM549 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM549 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[24008] As mentioned hereinabove with reference to Fig. 1, a function of VGAM549 gene, herein designated VGAM is inhibition of expression of VGAM549 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM549 correlate with, and may be deduced from, the identity of the target genes which VGAM549 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[24009] Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609) is a VGAM549 host target gene. ACADSB BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by ACADSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:7312, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24010] A function of VGAM549 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609). Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB. Arginine Vasopressin Receptor 1A (AVPR1A, Accession NM\_000706) is another VGAM549 host target gene. AVPR1A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AVPR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AVPR1A BINDING SITE, designated SEQ ID:6375, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ

ID:3260.

[24011] Another function of VGAM549 is therefore inhibition of Arginine Vasopressin Receptor 1A (AVPR1A, Accession NM\_000706), a gene which mediates cell contraction and proliferation, platelet aggregation, release of coagulation factor, and glycogenolysis. Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AVPR1A. The function of AVPR1A has been established by previous studies. The antidiuretic hormone vasopressin (OMIM Ref. No. 192340) is a cyclic nonapeptide involved in the control of body fluid osmolality, blood volume, blood pressure, and vascular tone. It acts by binding to G protein-coupled membrane receptors (see OMIM Ref. No. AVPR1B, 600264). One member of this receptor family is AVPR1A, which mediates cell contraction and proliferation, platelet aggregation, release of coagulation factor, and glycogenolysis. AVP action through the V1A receptor is mediated by activating phospholipase C, which in turn stimulates phosphatidylinositol turnover to increase intracellular calcium ion. Morel et al. (1992) cloned the rat hepatocyte V1A receptor. Based on that sequence, Thibonnier et al. (1994) screened a human liver cDNA library. The

cDNA encodes a predicted protein of 418 amino acids with 7 putative transmembrane domains as seen in other G protein-coupled receptors. The protein was 72% identical to the rat sequence and 36% identical to the human V2 receptor (see OMIM Ref. No. 304800). Human oxytocin receptor (OMIM Ref. No. 167055) was 45% similar to AVPR1A. Recombinant V1A was expressed and localized to the cell surface. Birnbaumer (2000) noted that the biologic effects of AVP are mediated by 3 receptor subtypes: the V1A and V1B receptors that activate phospholipases via Gq/11, and the V2 receptor that activates adenylyl cyclase by interacting with GS. Isolation of the cDNAs encoding the V1A and V1B receptor subtypes explained the tissue variability of V1 antagonist binding, whereas identification of the cDNA and gene encoding the V2 receptor provided the information to identify the mutations responsible for X-linked nephrogenic diabetes insipidus (OMIM Ref. No. 304800). Mutations that abrogate the production and/or release of AVP from the pituitary have diabetes insipidus as their most dramatic manifestation, indicating that the maintenance of water homeostasis is the most important physiologic role of this neuropeptide. Animal model experiments lend further support to the func-

tion of AVPR1A. Arginine vasopressin influences male reproductive and social behaviors in several vertebrate taxa through its actions at the V1A receptor in the brain. The neuroanatomic distribution of vasopressin V1A receptors varies greatly between species with different forms of social organization. Young et al. (1999) demonstrated that centrally administered arginine vasopressin increases affiliative behavior in the highly social, monogamous prairie vole, but not in the relatively asocial, promiscuous montane vole. While no significant differences were found in the coding regions of the V1A receptor of the 2 species, the 5-prime flanking region of the V1A gene displayed marked differences between the species. In the prairie vole V1A receptor gene, the 5-prime flanking region contained a 428-bp sequence that is rich in microsatellite DNA. This sequence was not found in the montane vole V1A gene, and sequences on either side of the expansion were contiguous in the montane vole gene. Another monogamous vole, the pine vole, was found to have the same 428-bp sequence in the 5-prime flanking region. Young et al. (1999) generated mice that were transgenic for the prairie vole receptor gene and found that they had a neuroanatomic pattern of receptor binding that was

similar to that of the prairie vole and exhibited increased affiliative behavior after injection with arginine vasopressin. Young et al. (1999) concluded that the pattern of V1A receptor gene expression in the brain may be functionally associated with species-typical social behaviors in male vertebrates.

[24012] It is appreciated that the abovementioned animal model for AVPR1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[24013] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[24014] Birnbaumer, M. : Vasopressin receptors. TEM 11: 406-410, 2000. ; and

[24015] Young, L. J.; Nilsen, R.; Waymire, K. G.; MacGregor, G. R.; Insel, T. R. : Increased affiliative response to vasopressin in mice expressing the V(1A) receptor from a monogamous vole. Na.

[24016] Further studies establishing the function and utilities of AVPR1A are found in John Hopkins OMIM database record ID 600821, and in cited publications numbered 737 and 7531-7535 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM\_003189) is another VGAM549 host target gene. TAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAL1 BINDING SITE, designated SEQ ID:9170, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24017] Another function of VGAM549 is therefore inhibition of T-cell Acute Lymphocytic Leukemia 1 (TAL1, Accession NM\_003189), a gene which may help control cell growth and differentiation. Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAL1. The function of TAL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Cadherin-like 26 (CDH26, Accession NM\_021810) is another VGAM549 host target gene. CDH26 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by CDH26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH26 BINDING SITE, designated SEQ ID:22371, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24018] Another function of VGAM549 is therefore inhibition of Cadherin-like 26 (CDH26, Accession NM\_021810). Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH26. FLJ12587 (Accession NM\_022480) is another VGAM549 host target gene. FLJ12587 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12587 BINDING SITE, designated SEQ ID:22849, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24019] Another function of VGAM549 is therefore inhibition of

FLJ12587 (Accession NM\_022480). Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12587. FLJ20073 (Accession NM\_017654) is another VGAM549 host target gene. FLJ20073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20073 BINDING SITE, designated SEQ ID:19163, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24020] Another function of VGAM549 is therefore inhibition of FLJ20073 (Accession NM\_017654). Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20073. MGC15875 (Accession NM\_032921) is another VGAM549 host target gene. MGC15875 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15875, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MGC15875 BINDING SITE, designated SEQ ID:26746, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24021] Another function of VGAM549 is therefore inhibition of MGC15875 (Accession NM\_032921). Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15875. MGC2654 (Accession NM\_024109) is another VGAM549 host target gene. MGC2654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2654 BINDING SITE, designated SEQ ID:23553, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24022] Another function of VGAM549 is therefore inhibition of MGC2654 (Accession NM\_024109). Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2654. LOC255251 (Accession XM\_171096) is another

VGAM549 host target gene. LOC255251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255251 BINDING SITE, designated SEQ ID:45907, to the nucleotide sequence of VGAM549 RNA, herein designated VGAM RNA, also designated SEQ ID:3260.

[24023] Another function of VGAM549 is therefore inhibition of LOC255251 (Accession XM\_171096). Accordingly, utilities of VGAM549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 550 (VGAM550) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[24024] VGAM550 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM550 was detected is described

hereinabove with reference to Figs. 1–8.

[24025] VGAM550 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA Virus 2–1. VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[24026] VGAM550 gene encodes a VGAM550 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM550 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM550 precursor RNA is designated SEQ ID:536, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:536 is located at position 4755 relative to the genome of Leishmania RNA Virus 2–1.

[24027] VGAM550 precursor RNA folds onto itself, forming VGAM550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[24028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM550 folded precursor RNA into VGAM550 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM550 RNA is designated SEQ ID:3261, and is provided hereinbelow with reference to the sequence listing part.

[24029] VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM550 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[24030] VGAM550 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM550 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM550 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[24031] The complementary binding of VGAM550 RNA, herein designated VGAM RNA, to host target binding sites on VGAM550 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM550 host target RNA into VGAM550 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.
